The No Project Alternative would satisfy this Project objective because under this alternative, the site would be developed consistent with the General Plan land use designation for the site, and the General Plan incorporates the provisions of the City's Bicycle and Pedestrian Master Plans. Both Reduced Project Alternative #1 and Reduced Project Alternative #2 would also achieve this objective by providing ample pedestrian and bicycle facilities throughout the Project site, which would connect to adjacent properties.

APPENDIX A

Initial Study, Notice of Preparation, and Comments

INITIAL STUDY

PROJECT TITLE

The Ranch

LEAD AGENCY NAME AND ADDRESS

City of Rancho Cordova
2729 Prospect Park Drive
Rancho Cordova, CA 95670

CONTACT PERSON AND PHONE NUMBER

June Cowles, Senior Planner
City of Rancho Cordova Planning Department
(916) 851-8756

PROJECT SPONSOR'S NAME AND ADDRESS

Olga Sciorelli
K. Hovnanian Homes
3721 Douglas Blvd. # 150
Roseville, CA 95661
(916) 945-5362

PURPOSE OF THE INITIAL STUDY

An Initial Study (IS) is a preliminary analysis which is prepared to determine the relative environmental impacts associated with a proposed project. It is designed as a measuring mechanism to determine if a project will have a significant adverse effect on the environment, thereby triggering the need to prepare an Environmental Impact Report (EIR). It also functions as an evidentiary document containing information which supports conclusions that the project will not have a significant environmental impact or that the impacts can be mitigated to a "Less Than Significant" or "No Impact" level.

This Initial Study has been prepared consistent with the California Environmental Quality Act (CEQA) Guidelines Section 15063, to determine if the proposed Ranch Project (project) may have a significant effect upon the environment. Based upon the findings and mitigation measures contained within this report, environmental impacts are significant enough to warrant the preparation of an EIR.

PROJECT DESCRIPTION

See the Notice of Preparation for a description of the proposed project, including the project location, General Plan designation, zoning, project background, project characteristics, and required approvals.

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

X	Aesthetics		Agriculture and Forest Resources	X	Air Quality
X	Biological Resources	X	Cultural Resources	X	Geology and Soils
X	Greenhouse Gasses	X	Hazards and Hazardous Materials	X	Hydrology and Water Quality
X	Land Use and Planning		Mineral Resources	X	Noise
X	Population and Housing	X	Public Services	X	Recreation
X	Transportation and Traffic	X	Tribal Cultural Resources	X	Utilities and Service Systems
X	Mandatory Findings of Significance				

DETERMINATION

On the basis of this initial evaluation:

	I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
	I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
X	I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
	I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
	I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Signature _____ Date _____

EVALUATION OF ENVIRONMENTAL IMPACTS

In each area of potential impact listed in this section, there are one or more questions which assess the degree of potential environmental effect. A response is provided to each question using one of the four impact evaluation criteria described below. A discussion of the response is also included.

- Potentially Significant Impact. This response is appropriate when there is substantial evidence that an effect is significant. If there are one or more "Potentially Significant Impact" entries, upon completion of the Initial Study, an EIR is required.
- Less than Significant With Mitigation Incorporated. This response applies when the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact". The Lead Agency must describe the mitigation measures and briefly explain how they reduce the effect to a less than significant level.
- Less than Significant Impact. A less than significant impact is one which is deemed to have little or no adverse effect on the environment. Mitigation measures are, therefore, not necessary, although they may be recommended to further reduce a minor impact.
- No Impact. These issues were either identified as having no impact on the environment, or they are not relevant to the project.

ENVIRONMENTAL CHECKLIST

This section of the Initial Study incorporates the most current Appendix "G" Environmental Checklist Form, contained in the CEQA Guidelines. Impact questions and responses are included in both tabular and narrative formats for each of the 19 environmental topic areas.

I. AESTHETICS -- WOULD THE PROJECT:

	Potentially Significant Impact	***Less Than Significant with Mitigation Incorporated***	***Less Than Significant Impact***	***No Impact***
a) Have a substantial adverse effect on a scenic vista?	X			
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?			X	
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	X			
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a, c, d): It has been determined that the potential impacts on aesthetics caused by the proposed project will require a more detailed analysis in the EIR. As such, the lead agency will examine each of the three potentially significant environmental issues listed in the checklist above in the EIR and will determine whether the proposed project will have a potentially significant impact on scenic vistas, the visual character of the site, and light and glare. At this point, a definitive impact conclusion for each of these environmental topics will not be made; rather, these three issues are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will provide a discussion of viewsheds, proximity to scenic vistas, existing lighting standards, thresholds of significance, a consistency analysis, cumulative impact analysis, and a discussion of feasible mitigation measures that should be implemented to reduce impacts on aesthetics. The EIR will identify applicable General Plan policies that protect the visual values located along public roadways and surrounding land uses, and will also address the potential for the project to substantially impair the visual character of the project vicinity. The analysis will address any proposed design and landscaping plans developed by the applicant and provide a narrative description of the anticipated changes to the visual characteristics of the project site as a result of project implementation and the conversion of the existing on-site land uses. The analysis will also address potential impacts associated with light spillage onto adjacent properties during nighttime activities.

Response b): The project site is not located adjacent to or in the vicinity of a state scenic highway. The project would have no impact related to the potential to substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings, within a state scenic

highway. Therefore, this impact would be ***less than significant***. This issue will not be addressed further.

II. AGRICULTURE AND FOREST RESOURCES -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?			X	
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?			X	
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined in Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?			X	
d) Result in the loss of forest land or conversion of forest land to non-forest use?			X	
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?			X	

RESPONSES TO CHECKLIST QUESTIONS

Responses a-e) The majority of the project site is depicted on the California Department of Conservation's Farmland Mapping and Monitoring Program (FMMP) as Grazing Land, with some portions of the site depicted as Urban and Built-Up Land. Grazing Land is suitable for the grazing of livestock and does not qualify as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance.

As discussed previously, the project site is currently zoned AG-80 by the City. As part of the proposed project, the entire project site would be rezoned from AG-80 to SPA. According to the most recent (2015/2016) Sacramento County Williamson Act Map, the project site is not under a Williamson Act contract. Potential conflicts for future development to conflict with existing zoning for agricultural use were addressed in the Rancho Cordova General Plan EIR under Impact 4.2.2, which identified potential conflicts between urban uses and agricultural uses, as a significant and unavoidable impact and Impact 4.2.4, which identified cumulative impacts associated with conversion of agricultural lands and agricultural/urban interface conflicts as a cumulatively considerable contribution to a significant and unavoidable impact (City of Rancho Cordova General Plan Draft EIR, pages 4.2-20 -4.2-26). The project will be required to implement all applicable mitigation measures, General Plan policies, and General Plan actions identified as measures to reduce environmental effect of Impacts 4.2.2 and 4.2.4.

The project site is not forest land (as defined in Public Resources Code section 1222(g)) or timberland (as defined in Public Resources Code section 4526), and the site is not zoned for forest land. The proposed project would not conflict with existing zoning for, or cause rezoning of, forest land or

timberland. The proposed project would not result in the loss of forest land or conversion of forest land to non-forest use. The proposed project does not involve changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use.

Therefore, impacts associated with agricultural and forest resources would be ***less than significant***. These issues will not be addressed further.

III. AIR QUALITY -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Conflict with or obstruct implementation of the applicable air quality plan?	X			
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	X			
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	X			
d) Expose sensitive receptors to substantial pollutant concentrations?	X			
e) Create objectionable odors affecting a substantial number of people?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-e): It has been determined that the potential impacts on air quality caused by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of the five potentially significant environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact on air quality. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will include an air quality analysis that presents the methodology, thresholds of significance, an impact analysis, and a discussion of feasible mitigation measures that should be implemented to reduce impacts on air quality. The air quality analysis will address air quality impacts, including the potential for the project to:

- conflict with or obstruct implementation of the applicable air quality plan;
- violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors);
- expose sensitive receptors to substantial pollutant concentrations; and/or
- create objectionable odors affecting a substantial number of people.

IV. BIOLOGICAL RESOURCES -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	X			
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	X			
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	X			
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	X			
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	X			
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-f): Based on the documented special status species, sensitive natural communities, wetlands, and other biological resources in the region, it has been determined that the potential impacts on biological resources resulting from the proposed project will require a detailed analysis. As such, the lead agency will examine each of the environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact on biological resources. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will provide a summary of local biological resources, including descriptions and mapping of plant communities, the associated plant and wildlife species, and sensitive biological resources known to occur, or with the potential to occur in the project vicinity. The analysis will will identify applicable thresholds of significance, provide an impact analysis, and, if necessary, discuss feasible mitigation

measures that should be implemented to reduce impacts on biological resources and to ensure compliance with federal and state regulations.

V. CULTURAL RESOURCES -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Cause a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines §15064.5?	X			
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines §15064.5?	X			
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	X			
d) Disturb any human remains, including those interred outside of formal cemeteries?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-d): Based on known historical and archaeological resources in the region, and the potential for undocumented underground cultural resources in the region, it has been determined that the potential impacts on cultural resources caused by the proposed project will require analysis in the EIR. As such, the lead agency will examine each of the four environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact on cultural resources. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will include an overview of the prehistory and history of the area, the potential for surface and subsurface cultural resources to be found in the area, the types of cultural resources that may be expected to be found, a review of existing regulations and policies that protect cultural resources, an impact analysis, and mitigation that should be implemented in order to reduce potential impacts to cultural resources.

VI. GEOLOGY AND SOILS -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:				
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	X			
ii) Strong seismic ground shaking?	X			
iii) Seismic-related ground failure, including liquefaction?	X			
iv) Landslides?	X			
b) Result in substantial soil erosion or the loss of topsoil?	X			
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	X			
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	X			
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?				X

RESPONSES TO CHECKLIST QUESTIONS

Responses a)i, a)ii, a)iii, a)iv, b, c, d): It has been determined that the potential impacts from geology and soils will require a detailed analysis in the EIR. As such, the lead agency will examine each of the seven potentially significant environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact associated with geology and soils. At this point, a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will include a review of existing geotechnical reports, published documents, aerial photos, geologic maps and other geological and geotechnical literature pertaining to the site and surrounding area to aid in evaluating geologic resources and geologic hazards that may be present. The EIR will include a description of the applicable regulatory setting, a description of the existing geologic and soils

conditions on and around the project site, an evaluation of geologic hazards, a description of the nature and general engineering characteristics of the subsurface conditions within the project site. This section of the EIR will identify applicable thresholds of significance, provide an impact analysis, and, if necessary, discuss feasible mitigation measures that should be implemented to reduce impacts associated with geology and soils.

Response e): The proposed project would connect to the municipal sewer system for wastewater disposal. Septic tanks or septic systems are not proposed as part of the project. As such, ***no impact*** would occur. This CEQA topic is not relevant to the proposed project and does not require further analysis.

VII. GREENHOUSE GAS EMISSIONS -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	X			
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gasses?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a), b): Implementation of the proposed project could generate greenhouse gases (GHGs) from a variety of sources, including but not limited to vehicle trips, vehicle idling, electricity consumption, water use, and solid waste generation. It has been determined that the potential impacts from GHG emissions by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of the environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact from GHG emissions. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

VIII. HAZARDS AND HAZARDOUS MATERIALS -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	X			
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	X			
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	X			
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	X			
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?			X	
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?			X	
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	X			
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-d, g-h): It has been determined that the potential impacts from hazards and/or hazardous materials by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of the six potentially significant environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact from hazards and/or hazardous materials. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will include a review of existing environmental site assessments and any other relevant studies for the project site to obtain a historical record of environmental conditions. The analysis will also include a review of recent records and aerial photographs. A site reconnaissance will be performed to

observe the site and potential areas of interest. Information on the current and historical use of the properties will be gathered, and the potential for project implementation to introduce hazardous materials to and from the area during construction and operation. This section will identify applicable thresholds of significance, provide an impact analysis, and, if necessary, discuss feasible mitigation measures that should be implemented to reduce impacts associated with hazards and hazardous materials.

Responses e-f): The project site is not located within an airport land use plan, nor within two miles of a public airport or private airstrip. The project site is located approximately four miles from the center of Mather Airport, a major, county-owned facility. Mather Airport is primarily used by air cargo carriers and general aviation (small, private aircraft). Mather Airport is also a major maintenance facility and houses the California Department of Forestry administrative and maintenance facilities. All air traffic arriving and departing Mather Airport is generally routed along a path more than 2.5 miles north of the project area. The proposed project is outside the airport's clear zone, approach-departure zone, and overflight zone, as indicated on the current Comprehensive Land Use Plan (CLUP) for Mather Airport (Airport Land Use Commission, 1997). Therefore, the proposed project would not result in a safety hazard for people residing or working in the area.

Given that the project site is located outside the existing and proposed CLUP boundaries, implementation would not conflict with operations of this airport facility. Therefore, impacts associated with airports and private air strips would be ***less than significant***. As such, these CEQA topics are not relevant to the proposed project and do not require further analysis. These issues will not be addressed further.

IX. HYDROLOGY AND WATER QUALITY -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Violate any water quality standards or waste discharge requirements?	X			
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	X			
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	X			
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	X			
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	X			
f) Otherwise substantially degrade water quality?	X			
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?			X	
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?			X	
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?			X	
j) Inundation by seiche, tsunami, or mudflow?			X	

RESPONSES TO CHECKLIST QUESTIONS

Responses a-f): It has been determined that the potential impacts on water quality, groundwater supplies, drainage, and runoff caused by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of the six potentially significant environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact on hydrology and water quality. At this point a definitive impact conclusion

for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will evaluate the potential construction and operational impacts of the proposed project on water quality. This section will describe the surface drainage patterns of the project site and adjoining areas, and identify surface water quality in the project site based on existing and available data. This section will identify impaired water bodies, listed pursuant to Section 303(d) of the federal Clean Water Act, in the vicinity of the project site. Conformity of the proposed project to water quality regulations will also be discussed. Mitigation measures will be developed to incorporate best management practices (BMPs), consistent with the requirements of the Central Valley Regional Water Quality Control Board to reduce the potential for site runoff.

This EIR will identify applicable thresholds of significance, provide an impact analysis, and, if necessary, discuss feasible mitigation measures that should be implemented to reduce impacts associated with hydrology and water quality.

Responses g-j): The project site is not located within a 100-year flood hazard area. The project site is located within Flood Zone X, which is not within the 100-year flood zone as shown on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) number 06067C0240H.

The project site is not located within a dam inundation area. The proposed project would not expose people or structures to a significant risk of loss, injury or death involving flooding as a result of the failure of a levee or dam. The project site is not anticipated to be inundated by a tsunami because it is located elevations ranging between 170 and 210 feet above MSL and is approximately 70 miles away from the Pacific Ocean which is the closest ocean waterbody. The project site is not anticipated to be inundated by a seiche because it is not located in close proximity to a water body capable of creating a seiche.

A mudflow is a category of landslide that is associated with heavy saturation of soils and sometimes is associated with seismicity. Factors such as the geological conditions, drainage, slope, vegetation, and others directly affect the potential for mudflow. The City's General Plan EIR does not identify mudslides as a topic of concern. Additionally, no steep areas that would have the potential to generate mudflows during operation would be created.

Therefore, impacts associated with flooding, dam inundation, and inundation by seiche, tsunami, or mudflow would be ***less than significant***. These issues will not be addressed further.

X. LAND USE AND PLANNING -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Physically divide an established community?			X	
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	X			
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	X			

RESPONSES TO CHECKLIST QUESTIONS

Response a): The proposed project includes development of residential, commercial, parks, and open space uses, including a natural resource preserve. The site is currently undeveloped and surrounded by existing and planned residential and other urban uses. The proposed project is consistent with the surrounding uses and would not physically divide an established community. Therefore, impacts associated with division of an established community would be ***less than significant***. This issue will not be addressed further.

Responses b-c): It has been determined that the potential land use and planning impacts caused by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of the two potentially significant environmental issues in the EIR and will determine whether the proposed project has the potential to have a significant impact. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will include a detailed discussion of the project as it relates to the existing General Plan, Zoning Code, and other local regulations. The local, regional, state, and federal jurisdictions potentially affected by the project will be identified, as well as their respective plans, policies, laws, and regulations, and potentially sensitive land uses. The proposed project will be evaluated for consistency with the City of Rancho Cordova General Plan, the Zoning Ordinance, and other local planning documents. This section of the EIR will identify thresholds of significance, provide an impact analysis, and, if necessary, discuss of feasible mitigation measures that should be implemented to ensure consistency applicable land use plans, policies, and regulations and to address potential conflicts with any applicable habitat conservation plan or natural community conservation plan.

XI. MINERAL RESOURCES -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?				X
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?				X

RESPONSES TO CHECKLIST QUESTIONS

Responses a-b): The California Division of Mines and Geology does not designate the project site or surrounding vicinity as a high quality resource area or a mineral resources zone. The project site is not designated as a locally-important mineral resource recovery site by the City. Given that no known mineral resources are located in the vicinity of the project site, implementation of the proposed project would not result in the loss of availability of a known mineral resource or of a locally-important mineral resource recovery site. Therefore, there would be ***no impact*** regarding mineral resources. These issues will not be addressed further.

XII. NOISE -- WOULD THE PROJECT RESULT IN:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	X			
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	X			
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	X			
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?	X			
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?			X	
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?			X	

RESPONSES TO CHECKLIST QUESTIONS

Responses a-d): Based on existing and projected noise levels along roadways, and the potential for noise generated during project construction and operational activities, it has been determined that the potential impacts from noise caused by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of the four potentially significant environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact from noise. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will identify the noise level standards contained in the City of Rancho Cordova General Plan Noise Element which are applicable to this project, as well as any germane state and federal standards. A noise study will be conducted and will include continuous (24-hour) and short-term noise measurements on the project site and in the project vicinity in order to quantify existing ambient noise levels from existing noise sources. The noise study will provide an estimate of existing traffic noise levels adjacent to the project-area roadways through application of accepted traffic noise prediction methodologies. Any significant noise sources other than local traffic within the project site will be identified and quantified through noise level measurements. The noise study will identify all significant noise impacts due to and upon development of the proposed project. The noise study will determine the land use compatibility of proposed uses as it may affect existing noise sensitive receptors in the project

site. An assessment of construction noise impacts and potential mitigation measures will also be provided. The study will present appropriate and practical recommendations for noise control aimed at reducing any noise impacts. The EIR will identify applicable thresholds of significance, provide an impact analysis, and, if necessary, discuss feasible mitigation measures that should be implemented to reduce impacts associated with noise.

Responses e-f): As discussed previously, the project site is located approximately four miles from the center of Mather Airport. The proposed project is outside all measured noise contours as indicated on the current CLUP for Mather Airport (Airport Land Use Commission, 1997). Additionally, there are no private airstrips within the vicinity of the project site. Therefore, impacts associated with airports and private air strips would be ***less than significant***. These issues will not be addressed further.

XIII. POPULATION AND HOUSING -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	X			
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?				X
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?				X

RESPONSES TO CHECKLIST QUESTIONS

Response a): It has been determined that the potential population and housing impacts caused by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine this environmental issue in the EIR and will determine whether the proposed project has the potential to have a significant impact. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will include a detailed discussion of the project characteristics as they relate to the existing General Plan Housing Element, and other local regulations. The local, regional, state, and federal jurisdictions potentially affected by the project will be identified, as well as their respective plans, policies, laws, and regulations, and potentially sensitive land uses. The proposed project will be evaluated for consistency the City of Rancho Cordova General Plan, the Zoning Ordinance, and other local planning documents. Planned development and housing and population trends in the region will be identified based on currently available plans. The EIR will provide an analysis of the project's potential to induce substantial population growth including the thresholds of significance, an impact analysis, and, if necessary, feasible mitigation measures that should be implemented.

Responses b-c): The project site is currently undeveloped and does not contain housing. The proposed project would not displace housing or people. There is ***no impact***, and these topics will not be further addressed in the EIR.

XIV. PUBLIC SERVICES

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
Fire protection?	X			
Police protection?	X			
Schools?	X			
Parks?	X			

RESPONSES TO CHECKLIST QUESTIONS

Response a): Implementation of the proposed project would result in increased demand for police, fire protection, schools, parks, and other public facilities in the area. It has been determined that the potential impacts from increased demands on public services caused by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of these environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a substantial adverse physical impact associated with public services. At this point, a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

During the preparation of the EIR, the public service providers will be consulted in order to determine existing service levels in the project area. This would include documentation regarding existing staff levels, equipment and facilities, current service capacity, existing service boundaries, and planned service expansions. Master plans from such public service providers and City policies, programs, and standards associated with the provision of public services will be described in the EIR. The EIR analysis will identify the thresholds of significance, provide an impact analysis, and, if necessary, discuss feasible mitigation measures that should be implemented reduce environmental impacts associated with public services.

XV. RECREATION

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	X			
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-b): Implementation of the proposed project would result in increased demand for parks, and other recreational facilities in the area. It has been determined that the potential impacts from increased demands to recreation facilities caused by the proposed project will require a detailed analysis in the EIR. As such, the lead agency will examine each of these environmental issues listed in the checklist above in the EIR, and will determine whether the proposed project has the potential to have a significant impact on recreational facilities. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

During the preparation of the EIR, the recreational facilities and services will be analyzed to determine existing service levels in the project area. This would include documentation regarding existing and future facility needs, current service capacity, and planned service expansions. City policies, programs, and standards associated with the provision of public services will be presented in the EIR.

The EIR will identify thresholds of significance, provide an impact analysis, and discuss of feasible mitigation measures that should be implemented reduce impacts associated with recreation.

XVI. TRANSPORTATION AND TRAFFIC -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?	X			
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?	X			
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?			X	
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	X			
e) Result in inadequate emergency access?	X			
f) Conflict with adopted policies, plans, or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-b, d-f): The proposed project includes the development of uses that will increase traffic on existing and planned roadways. The circulation design includes roadway improvements intended to accommodate traffic patterns in the area. Based on existing and projected traffic volume levels along roadways, it has been determined that the potential traffic impacts caused by the proposed project will require a detailed analysis in the EIR. As such, the EIR will examine each of the five potentially significant environmental issues listed in the checklist above and will determine whether the proposed project has the potential to have a significant impact from traffic. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is conducted in the EIR.

The EIR will describe existing and future traffic conditions and will identify the trips that will be generated by the project and the projected distribution of those trips on the roadway system. The EIR will analyze traffic impacts associated with the project under existing and cumulative conditions. Potential impacts associated with site access and on-site circulation will also be addressed in the EIR. The EIR will identify applicable thresholds of significance, provide an impact analysis, and discuss feasible mitigation measures that should be implemented reduce impacts associated with transportation/traffic.

Responses b-c): The proposed project does not include airport or airstrip facilities and is not located adjacent to an airport or airstrip. As noted previously, the proposed project is outside the airport's clear zone, approach-departure zone, and overflight zone, as indicated on the current CLUP for Mather Airport (Airport Land Use Commission, 1997). The proposed project does not include towers or other elevated structures. The proposed project would not result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks. This impact would be ***less than significant***. This issue will not be addressed further.

XVII. TRIBAL CULTURAL RESOURCES

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k)?	X			
b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1? In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resources to a California Native American tribe.	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-b): Based on known historical, cultural, tribal, and archaeological resources in the region, and the potential for undocumented underground cultural resources in the region, it has been determined that the potential impacts on tribal cultural resources will require analysis in the EIR. As such, the lead agency will examine the two environmental issues listed in the checklist above in the EIR and will determine whether the proposed project has the potential to have a significant impact on tribal cultural resources. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will include an overview of the prehistory and history of the area, the potential for surface and subsurface tribal cultural resources to be found in the area, the types of tribal cultural resources that may be expected to be found, the results of consultation with Native American tribes, a review of existing regulations and policies that protect tribal cultural resources, an impact analysis, and, if necessary, identification of mitigation that should be implemented in order to reduce potential impacts to tribal cultural resources.

XVIII. UTILITIES AND SERVICE SYSTEMS -- WOULD THE PROJECT:

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	X			
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	X			
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	X			
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	X			
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the projects projected demand in addition to the providers existing commitments?	X			
f) Be served by a landfill with sufficient permitted capacity to accommodate the projects solid waste disposal needs?	X			
g) Comply with federal, state, and local statutes and regulations related to solid waste?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a-g): Implementation of the proposed project would result in increased demands for utilities to serve the project. As such, the EIR will examine each of the seven environmental issues listed in the checklist above and will determine whether the proposed project has the potential to have a significant impact to utilities and service systems. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

The EIR will analyze wastewater, water, and storm drainage infrastructure, as well as other utilities (i.e. solid waste, gas, electric, etc.), that are needed to serve the proposed project. The wastewater assessment will include a discussion of the proposed collection and conveyance system, treatment methods and capacity at the treatment plants, disposal location(s) and methods, and the potential for recycled water use for irrigation. The EIR will analyze the impacts associated with on-site construction of the conveyance system, including temporary impacts associated with the construction phase. The proposed infrastructure will be presented. The EIR will provide a discussion of the wastewater treatment plant that will serve the project, including current demand and capacity at the plant. The

analysis will discuss the proposed wastewater infrastructure, disposal methods and location, including environmental impacts and permit requirements associated with disposal of treated wastewater.

The storm drainage analysis will include a discussion of the proposed drainage collection system including impacts associated with on-site construction of the storm drainage system. The EIR will identify permit requirements and, if necessary, mitigation needed to minimize and/or avoid significant impacts will be described.

The EIR will identify the proposed water supply infrastructure and water demand, identify applicable thresholds of significance and permit requirements, analyze the impacts associated with construction and operation of the water system, and, if necessary, mitigation needed to minimize and/or avoid significant impacts will be described.

The EIR will also address solid waste collection and disposal services for the proposed project. This will include an assessment of the existing landfill capacity, the project's solid waste generation, and whether there is sufficient capacity to meet the project demands. The project's potential to result in impacts associated with solid waste will be analyzed and, if necessary, mitigation needed to minimize and/or avoid significant impacts will be described.

XVIV. MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	*Less Than Significant with Mitigation Incorporated*	*Less Than Significant Impact*	*No Impact*
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	X			
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	X			
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	X			

RESPONSES TO CHECKLIST QUESTIONS

Responses a, c): It has been determined that the potential for the proposed project to: degrade the quality of the environment; substantially reduce the habitat of a fish or wildlife species; cause a fish or wildlife population to drop below self-sustaining levels; threaten to eliminate a plant or animal community; reduce the number or restrict the range of a rare or endangered plant or animal; eliminate important examples of the major periods of California history or prehistory; or adversely affect human beings will require more detailed analysis in an EIR. As such, the EIR will examine each of these environmental issues and will determine whether the proposed project has the potential to have a significant impact on these environmental issues. At this point a definitive impact conclusion for each of these environmental topics will not be made, rather all are considered ***potentially significant*** until a detailed analysis is prepared in the EIR.

Response b): The Draft EIR will address cumulative impacts, including ***potentially significant*** cumulative impacts associated with the following:

- aesthetics;
- air quality;
- biological resources;
- cultural resources;
- geology and soils;
- greenhouse gas emissions;
- hazards and hazardous materials;
- hydrology and water quality;

- land use and planning;
- noise;
- population and housing;
- public services;
- recreation;
- transportation and traffic;
- tribal cultural resources; and
- utilities and service systems.

As discussed previously, implementation of the proposed project would not result in conversion Prime Farmland, Unique Farmland, or Farmland of Statewide Importance, and would not conflict with a Williamson Act contract. The project site is not forest land or timberland. Potential cumulative impacts associated with agricultural and forestry resources were adequately addressed in the Rancho Cordova General Plan EIR as previously described. Cumulative impacts associated with agricultural and forestry resources will not be addressed further.

As discussed previously, implementation of the proposed project would not result in the loss of a high quality resource area or a mineral resources zone and would thus not have a considerable contribution to cumulative impacts associated with mineral resources. Cumulative impacts associated with mineral resources will not be addressed further.

NOTICE OF PREPARATION

DATE: **July 6, 2018**

TO: **Responsible Agencies, Organizations and Interested Parties**

LEAD AGENCY: **City of Rancho Cordova**
Contact: June Cowles
2729 Prospect Park Drive
Rancho Cordova, CA 95670

SUBJECT: **Environmental Impact Report for The Ranch Project.**

In discharging its duties under Section 15021 of the California Environmental Quality Act (CEQA) Guidelines, the City of Rancho Cordova (as Lead Agency) intends to prepare an Environmental Impact Report (EIR) for The Ranch Project. The City will be the lead agency for compliance with the California Environmental Quality Act ("CEQA").

In accordance with Section 15082 of the CEQA Guidelines, the City of Rancho Cordova has prepared this Notice of Preparation to provide Responsible Agencies and other interested parties with sufficient information describing the proposal and its potential environmental effects.

The determination to prepare an Environmental Impact Report was made by the City of Rancho Cordova. An Initial Study, attached hereto, has been prepared pursuant to CEQA Guidelines Section 15063, which identifies the anticipated environmental effects of the project. The Initial Study satisfies the City's obligation under CEQA Guidelines Section 15082, subdivision (a)(1)(C), to identify the "probable environmental effects of the project."

As specified by the CEQA Guidelines, the Notice of Preparation will be circulated for a 30-day review period. The City of Rancho Cordova welcomes public input during this review. In the event that no response or request for additional time is received by any Responsible Agency by the end of the review period, the Lead Agency may presume that the Responsible Agency has no response.

PUBLIC MEETING
A Public Scoping Meeting will be held on July 26, 2018 at 5:30 p.m.
in the Rancho Cordova City Hall, American River South Room
2729 Prospect Park Drive, Rancho Cordova

Comments may be submitted in writing during the review period and addressed to:

June Cowles, Senior Planner
City of Rancho Cordova
2729 Prospect Park Drive
Rancho Cordova, CA 95670

The comment period closes on August 6, 2018.

A. PROJECT LOCATION, CURRENT USE, AND SURROUNDING USES

The project site consists of approximately 530 acres located in the City of Rancho Cordova city limits. The project site is bound by existing single-family residential uses and Douglas Road to the north, vacant land and Grant Line Road to the east, vacant land and Kiefer Boulevard to the south, and Rancho Cordova Parkway, single family residential, and vacant land on the west. (See **Figure 1** and **Figure 2**). The project parcel is Sacramento County Assessor's Parcel Number (APN) 067-004-0008.

The project site is currently vacant and has been previously used for agricultural uses (cattle grazing). The topography of the site exhibits low relief topography with elevations ranging between 170 and 210 feet above mean sea level (MSL). The slopes throughout the site range from approximately zero to eight percent. The site is characterized by moderate rolling hills and areas of extensive flatlands, with wetlands, vernal pools, and seasonal drainage courses scattered throughout the site. A headwater tributary of Morrison Creek traverses the project site, entering at the northeast corner and flowing generally to the southwest. A total of 21.53 acres of jurisdictional aquatic resources have been mapped with the project site, including: 2.92 acres of depressional seasonal wetlands, 15.04 acres of vernal pools, 1.66 acres of riverine seasonal wetlands, 0.06 acres of riverine seasonal wet swales, 1.54 acres of intermittent drainages, and 0.30 acres of drainage basin outfalls.

The property is traversed by a 275-foot-wide utility easement occupied by a 230-kV Pacific Gas and Electric (PG&E) transmission line, one 230-kV Sacramento Municipal Utility District (SMUD) transmission line, and one 69-kV SMUD sub-transmission line. No other public utilities (water, sewer, drainage) are located on site.

The project site is bound by the Sunridge Specific Plan to the north, east, and west, and by the SunCreek Specific Plan to the south and east. Land uses anticipated to the east and south of the project site by the Sunridge Specific Plan and the SunCreek Specific Plan include low, medium, and high density residential uses, commercial mixed uses (retail, office, and retail professional), and neighborhood parks. Other land uses located nearby include new elementary, junior and senior high schools. See **Figure 2** and **Figure 3**.

B. PROJECT OBJECTIVES

Consistent with CEQA Guidelines Section 15124(b), a clear statement of objectives and the underlying purpose of the proposed project shall be discussed. The principal objective of the proposed project is the approval and subsequent implementation of The Ranch Project (the proposed project). The quantifiable objectives of the proposed project include development of the approximately 530-acre site with: 1,375 single family residential units, including 689 age restricted single-family units with a club house and other recreational opportunities; dedication of approximately six acres for commercial use; and dedication of approximately five acres for multi-family residential uses in accordance with the City of Rancho Cordova's Affordable Housing Plan.

The proposed project identifies the following objectives:

- Respect the project site's existing natural features through preservation of 198 acres of wetlands, vernal pools, and open space;

- Create a high-quality development that implements the vision of the General Plan, which designates the project site for development with a local town center, a mix of residential densities, and a natural resources preserve;

- Provide a residential development that would assist the City in meeting its housing needs, including a range of housing types to serve the senior population;

- Provide a residential development that would assist the City in meeting its affordability goals providing housing at many price points and attract residents from different areas;

- Create of a unique age-restricted community that provides a mix of housing types and amenities, including a club house and recreation facility,

- Accommodate neighborhood-serving commercial uses as part of the town center; and

- Implement the City's Bicycle and Pedestrian Master Plans through providing an on-site bicycle and pedestrian network that is accessible by the general public and provides opportunities for connectivity with bicycle and pedestrian facilities on adjacent properties.

C. PROJECT CHARACTERISTICS

The project proposes an approximately 530-acre residential community. Development would include approximately 1,375 single family residential units (including 689 age restricted single-family units), up to 120 multifamily units, a six-acre commercial parcel, a community clubhouse, a park and trail system, open space, and supporting infrastructure. **Figure 4** depicts the project characteristics and **Table 1** summarizes the proposed uses.

Table 1: Land Use Summary

PROPOSED USE	GROSS ACRES	NET ACRES	DWELLING UNITS	NON-RESIDENTIAL SQUARE FEET	GROSS DENSITY (UNITS/ACRE)	NET ACREAGE AS PERCENTAGE OF TOTAL
Single Family Residential						
Village 1 (60x105)	18.9	14.87	91	-	4.81	2.8%
Villages 2,11 (50x105)	32.43	24.74	178	-	5.49	4.7%
Villages 3,4 (45x105)	24.11	17.03	137	-	5.68	3.2%
Villages 5,9,10 (45x85)	16.71	10.84	114	-	6.82	2.0%
Villages 6,7,8 (36x70)	17.65	11.86	166	-	9.41	2.2%
	109.8	*79.34*	*686*	-	*6.25*	*15.0%*
Single Family Residential – Age Restricted						
Villages 12,21 (60x105)	29.52	20.78	123	-	4.17	3.9%
Villages 17,19 (50x105)	24.78	18.64	140	-	5.65	3.5%
Villages 14,15,16 (45x105)	42.94	32.01	265	-	6.17	6.0%

Proposed Use	Gross Acres	Net Acres	Dwelling Units	Non-Residential Square Feet	Gross Density (Units/Acre)	Net Acreage as Percentage of Total
Villages 13,20 (52x64)	21.48	14.22	148	-	6.89	2.7%
Village 18 (varying size)	2.29	1.67	13	-	5.68	0.3%
	121.01	*87.32*	*689*	-	*5.69*	*16.2%*
Mixed Use (Residential and Commercial)						
Village 22	13.56	12.7	120	46,000	8.85	2.4%
Subtotal	*13.56*	*12.7*	*120*	*46,000*	*8.85*	*2.4%*
Parks and Community Facilities						
Recreation Center (Lot A)	5.49	5.03	-	20,000 to 27,000	-	1.0%
Park (Lot B)	1.69	1.40	-		-	0.3%
Park (Lot C)	10.42	10.18	-			1.9%
Subtotal	*17.6*	*16.61*	-		-	*3.1%*
Open Space						
Protected Areas (Lots D, E)	225.66	199.76	-	-	-	37.8%
Protected Area / Landscape (Lots F-J)	-	25.11	-	-	-	4.8%
Water Quality / Detention	12.62	9.64	-	-	-	1.8%
Open Space	14.47	13.75	-	-	-	2.6%
Public Landscape Lot (Lots R-MM)	-	6.69	-	-	-	1.3%
Private Landscape Lot (Lots NN-FFF)	-	2.96	-	-	-	0.6%
Subtotal	*252.75*	*257.91*	-	-	-	*48.8%*
Roads						
Private Drive (Lots 1-26)	-	1.01	-	-		0.2%
Private Right-of-Way (Lots 27 & 28)	-	28.16	-	-		5.3%
Minor Right-of-Way	-	31.67	-	-		6.0%
Major Right-of-Way	15.34	15.34	-	-		2.9%
Subtotal	*15.34*	*76.18*	-	-	-	*14.4%*
TOTAL	**530.06**	**530.06**	**1,375 single family and up to 120 multifamily**	**66,000 to 73,000**	**2.82**	**100.0%**

Residential

The project includes three primary residential components: an unrestricted single family community, an age-restricted single family community, and a mixed use development.

Single Family (Unrestricted)

The single family community, comprised of Villages 1 through 11, is located in the northwest area of the project site, abutting residential neighborhoods to the north and Rancho Cordova Parkway to the west. This area would include 686 single family residences within 11 residential neighborhoods. Village 1 would have 91 residential lots with a typical dimension of 60' by 105'

and a typical size of 6,300 square feet (s.f.). Villages 2 and 11 would have 178 residential lots with a typical dimension of 50' by 105' and a typical size of 5,250 s.f. Villages 3 and 4 would have 137 residential lots with a typical dimension of 45' by 105' and a typical size of 4,725 s.f. Villages 5, 9, and 10 would have 114 residential lots with a typical dimension of 45' by 85' and a typical size of 3,910 s.f. Villages 6, 7, and 8 would have 166 residential lots with a typical dimension of 36' by 70' and a typical size of 2,520 s.f.

Single Family – Four Seasons Age-Restricted

The Four Seasons age-restricted single family community is located in the southeast portion of the project site, and borders the approved Sunridge Specific Plan to the south and east. The Four Seasons community is separated from the unrestricted single family community by the wetlands preserve that traverses the project site from the northeast to the southwest. Villages 12 and 21 would have 123 residential lots with a typical dimension of 60' by 105' and a typical size of 6,300 s.f. Villages 17 and 19 would have 140 residential lots with a typical dimension of 50' by 105' and a typical size of 5,250 s.f. Villages 14, 15, and 16 would have 265 residential lots with a typical dimension of 45' by 105' and a typical size of 4,725 s.f. Villages 13 and 20 would have 148 residential lots with a typical dimension of 52' by 64' and and a typical size of 3,328 s.f. Village 18 would have 13 residential lots with a typical lot size of 5,595 s.f. and varying lot dimensions. Additionally, a 20,000 s.f. to 27,000 s.f. community clubhouse would be developed in this area.

Residential and Commercial Mixed Use

A 13.56-acre residential mixed use parcel is located in the northwest portion of the site, near the entrances to the unrestricted single family community from Rancho Cordova Parkway. This parcel would accommodate approximately 46,000 s.f. of commercial uses and up to 120 multifamily units.

Open Space

The project would preserve approximately 199.76 acres as a nature preserve that would be deeded to a third-party conservation entity. The project includes approximately 14.8 acres of existing aquatic resources, including 1.85 acres of depressional seasonal wetlands, 9.97 acres of vernal pools, 1.15 acres of riverine seasonal wetlands, 1.53 acres of intermittent drainages, and 0.30 acres of drainage basin outfalls. The project applicant would incorporate protections for the preservation of wetland resources within the preserve, including preserve fencing, long-term funding and management of the preserve in perpetuity, and protection of the preserve from drainage and runoff generated from development areas through the construction of several detention basins throughout the site.

Recreation

Park and recreation facilities totaling 16.61 acres would be provided by the project. The project would use a combination of land dedication and in-lieu fees to comply with the requirements of Chapter 22.40 of the City of Rancho Zoning Ordinance.

Approximately 2.14 miles of public trails would be developed throughout the project site, as described below under Pedestrian and Bicycle Connectivity. See **Figure 4**. Trails along the

preserve boundaries would be designed in accordance with the South Sacramento Habitat Conservation Plan (SSHCP) standards.

As part of the 16.61 acres of recreational facilities, a public park (10.18 net acres) would be provided within the single family (unrestricted) community. The utility corridor would be located along the eastern boundary of the park.

Within the age-restricted portion of the project, approximately 6.43 acres would be dedicated for recreational purposes. The recreation center (5.03 acres) would include a clubhouse serving as a recreation, community gathering, activity, and information hub for residents. A separate 1.4-acre community garden would be provided within the age-restricted community. In addition, multiple paseos would be provided throughout the age-restricted community to provide connectivity and off-road walkability.

Circulation

Vehicle Circulation
On-site infrastructure associated with the project would include the construction of internal and external access roads and a network of bicycle and pedestrian trails as shown in **Figure 4**. Primary access would be from Rancho Cordova Parkway. The project would provide for future connections to an extension of Chrysanthy Boulevard east of the project site.

Rancho Cordova Parkway would be constructed as a minor arterial roadway with an exception along existing and proposed nature preserves. Portions of the roadway along existing and proposed nature preserves would be constructed with an attached sidewalk, as is currently constructed at the western side of the road, and an eight-foot-wide divided median landscaped with trees and shrubs. The primary entrance to the project site at the intersection of Chrysanthy Boulevard and Rancho Cordova Parkway would be controlled by a four-way stop or traffic signal. A second right-in, right-out entrance from Rancho Cordova Parkway would be located to the south of the primary entrance.

Chrysanthy Boulevard would be constructed as a minor arterial with 74-foot right-of-way and a 15-foot landscape corridor for landscaping and sidewalks.

North Campus Road, located along the southern boundary of the age-restricted community, would include one travel lane and frontage improvements along the residential portion of the project site.

Interior streets serving the residential communities would have attached sidewalks and rolled curbs along residential frontages.

Two emergency vehicle access points would be located at the southern ends of Streets MM and GG. Access at these locations would provide full access for emergency vehicles, but would be limited to right-out only for residents

Pedestrian and Bicycle Connectivity
A bicycle/pedestrian trail located along the existing utility corridor would connect to an existing trail located north of the site and would provide connections to the two trails located along the preserve. On the northern side of Chrysanthy Boulevard, a preserve trail would extend from the bike/pedestrian trail located within the utility corridor along Chrysanthy Boulevard, then would follow the northern boundary of the age-restricted community to the eastern border of the project site. A southern preserve trail would extend along Rancho Cordova Parkway, south of the entrances to the project site, and would cross the project site south of the unrestricted community, connecting with Chrysanthy Boulevard in two locations, then following the western edge of the age-restricted community to the south.

In addition, the project will include sidewalks, stop signs, standard pedestrian crossing warning signs, lane striping to provide a bicycle lane along applicable roadways, bicycle parking, signs to identify pedestrian and bicycle paths, and pedestrian signal heads. Sidewalks will be constructed as part of the frontage improvements along all new roadway construction for Jaeger Road/Rancho Cordova Parkway and Chrysanthy Boulevard in conformance with applicable design standards.

Infrastructure and Public Services
Water
The project is located within the Sacramento County Water Agency (SCWA) Zone 40 water service area. The project would connect to SCWA existing water supply infrastructure located at the intersection of Rancho Cordova Parkway and Chrysanthy Boulevard. New water distribution pipelines and valves would be provided within the project site, primarily within the roadway right-of-ways, to serve the proposed development.

Sewer
The project is located within the Sacramento Area Sewer District (SASD) and Sacramento Regional County Sanitation District (RegionalSan) service areas. New sewer conveyance pipelines would be provided within the project site, primarily within the roadway right-of-ways, to serve the proposed development. The project would connect to existing SASD sewer infrastructure located at the intersection of Rancho Cordova Parkway and Chrysanthy Boulevard. Sewer flows from the project would be conveyed by SASD facilities to RegionalSan interceptor, collector, and trunk facilities and would then be conveyed to the Sacramento Regional Wastewater Treatment Plant for treatment.

Off-site improvements may include upgrades to the existing sewer lift station that serves the eastern part of Rancho Cordova.

Drainage
The project would include development of on-site drainage and water quality basins to accommodate post-construction peak stormwater flows and provide for water quality treatment. The on-site system would connect to the City's stormwater drainage system.

Electric, Natural Gas, and Solid Waste
Electricity would be provided by SMUD. Natural gas would be provided by PG&E. Solid waste collection would be provided by Republic Services.

Public Services
Police services would be provided by the City of Rancho Cordova. Fire protection would be provided by Sacramento Metropolitan Fire District. Public school services would be provided by Elk Grove Unified School District.

General Plan Amendment and Rezone
The project site is currently designated Urban Development Area (UDA) in the City's General Plan and is currently zoned Agriculture, 80-Acre Minimum (AG-80). The entire project site would be rezoned from AG-80 to Special Planning Area (SPA). Table 2 summarizes the proposed General Plan land use designations:

Table 2: General Plan Land Use Designations

LAND USE DESIGNATION	EXISTING	PROPOSED	DIFFERENCE
Urban Development Area (UDA)	530.1	--	- 530.1
Low Density Residential (LDR)	--	181.9	+ 181.9
Medium Density Residential (MDR)	--	80.9	+ 80.9
Residential Mixed Use (RMU)	--	6.3	+ 6.3
Commercial Mixed Use (CMU)	--	7.2	+ 7.2
Parks and Open Space (P/OS)	--	16.2	+ 16.2
Natural Resources (NR)	--	222.0	+ 222.0
Right-of-Way	--	15.6	+ 15.6

Special Planning Area
The Ranch Special Planning Area (SPA) zoning will establish development standards and design guidelines to ensure quality and consistency in the design and implementation of the project. The SPA document is regulatory in nature and will serve as zoning for the project site. Development plans, subdivision maps, and site plans for the project must be consistent with both the SPA and the City of Rancho Cordova General Plan.

D. REQUIRED APPROVALS

City of Rancho Cordova: Actions that would be required from the City Council, Planning Commission, and/or City staff may include, but is not limited to, the following:

- Approval of the General Plan Amendment from UDA to LDR, MDR, RMU, CMU, P/OS, and NR;
- Approval of the Community Plan Amendment from UDA to LDR, MDR, RMU, CMU, P/OS, and NR;
- Approval of the Rezone from AG-80 (County) to SPA (City);
- Approval of the The Ranch Special Planning Area regulatory document;
- Approval of the Tentative Subdivision Map; and
- Approval of design review, improvement plans, and building permits.

Other discretionary approvals that may be required by other governmental agencies may include, but are not limited to, the following:

- Take permits from the U.S., Fish and Wildlife Service (USFWS) and the California Department of Fish and Wildlife (CDFW) under the Federal and State Endangered Species Acts;
- Water quality permitting (NPDES and water quality certifications) under the Clean Water Act by the Central Valley Regional Water Quality Control Board;
- Wetland fill permits under Section 404 of the Clean Water Act by the U.S. Army Corps of Engineers;
- Approval of infrastructure details for water supply facilities by the Sacramento County Water Agency; and
- Approval of infrastructure details for wastewater collection facilities by Sacramento Area Sanitation District.

E. PROJECT BACKGROUND

The Ranch project site has been the subject of previous environmental review. The project site is located within the Sunrise Douglas Community Plan and Sunridge Specific Plan areas, which were approved by Sacramento County prior to the incorporation of the City.

In 2006, the City certified the Preserve at Sunridge EIR and subsequently approved entitlements for the Preserve at Sunridge project. The Preserve at Sunridge project was proposed on the same site as the currently proposed The Ranch project. The Preserve at Sunridge included 2,703 dwelling units (both single family and multi-family residential) commercial and office, neighborhood parks, an elementary school, detention/water quality basins, an open space/wetland preserve, pedestrian facilities, bikeways, and parkways/drainage corridors. The project included a 92.4-acre wetland preserve located at the southwest corner of the project site.
On September 5, 2006 following the City's approval of the Preserve at Sunridge project, the California Native Plant Society (CNPS) filed a petition for writ of mandate in Sacramento County Superior Court seeking to set aside the City's actions. The case was litigated in Superior

Court and appealed to the Court of Appeal, Third Appellate District. On March 24, 2009, the Third Appellate District filed an opinion upholding the judgment of the Superior Court with respect to the determination of the project's inconsistency with the City's General Plan regarding interconnection of preserved habitat areas that support special-status plant and animal species, and regarding mitigation on such species. The case was sent back to the Sacramento County Superior Court, which entered final judgment issuing a peremptory writ of mandate on September 28, 2009. The writ of mandate nullified all of the City's approvals for the project, including certification of the EIR.

During the course of the court proceedings, ownership of the project site was transferred to K. Hovnanian Communities. The project was redesigned and resubmitted as the Ranch at Sunridge to the City in 2010. In 2011, the City issued a Notice of Preparation for an Environmental Impact Report/Environmental Impact Statement. The EIR/EIS was not completed.

The project Applicant Team has submitted an application to the U.S. Army Corps of Engineers for a Clean Water Act (CWA) Section 404 permit associated with discharges of fill material into waters of the United States for fill of 6.37 acres of waters of the United States and temporary impacts to approximately 0.01 acres of waters of the United States. The permit is being processed by the U.S. Army Corps of Engineers and a determination by the U.S. Army Corps of Engineers is anticipated in 2018.

F. POTENTIAL ENVIRONMENTAL EFFECTS

See the Initial Study for discussion of potential environmental effects of the proposed project, including potential impacts that will be analyzed in the Draft EIR.

To: June Cowles
Cc: Wildlife R2 CEQA
Subject: Comments on the Notice of Preparation for The Ranch (SCH# 2018072011)

Mrs. Cowles,

The California Department of Fish and Wildlife (CDFW) received and reviewed the **Notice of Preparation** for **The Ranch** (Project) in Sacramento County pursuant the California Environmental Quality Act (CEQA).

CDFW offers the comments and recommendations below to assist Lead Agency in adequately identifying and, where appropriate, mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources.

The South Sacramento Habitat Conservation Plan (Plan) is nearing implementation. As a participating entity with a proposed project in the Plan area, CDFW recommends the draft Environmental Impact Report prepared by the Lead Agency be consistent with the Plan.

Notification to CDFW is required, pursuant to Fish and Game Code section 1602 if a Project proposes activities that will substantially divert or obstruct the natural flow of water; substantially change or use any material from the bed, channel or bank of any river, stream, or lake; or deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake. The Project description has proposed activities that may be subject to Notification under Fish and Game Code section 1602. Some of these activities include but are not limited to the grading/filling or crossing of existing hydrologic features at the Project's location. CDFW approval of projects subject to Notification under Fish and Game Code section 1602 is facilitated when the environmental documentation discloses the impacts to and proposes measures to avoid, minimize, and mitigate impacts to perennial, intermittent, and ephemeral rivers, streams, and lakes, other features, and any associated biological resources/habitats present within the Project study area. CDFW relies on the Lead Agency environmental analysis when acting as a responsible agency if it is necessary to issue a Lake or Streambed Alteration Agreement for the Project. Addressing the Department comments ensures that the environmental document appropriately addresses project impacts and facilitating the approval of the Project. Please visit https://www.wildlife.ca.gov/Conservation/LSA for more information about obtaining a Lake or Streambed Alteration Agreement.

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the project that may affect California fish and wildlife. I am available for consultation regarding biological resources and strategies to minimize and/or mitigate impacts.

Sincerely,

Dylan Wood

California Department of Fish and Wildlife

Cordova Recreation & Park District

August 3, 2018

June Cowles, Senior Planner
City of Ranch Cordova
2729 Prospect Park Drive
Rancho Cordova, CA 95670

RE: The Ranch Project in the City of Rancho Cordova
Notice of Preparation dated July 6, 2018
Comments by Cordova Recreation and Park District

Dear Ms. Cowles,

Thank you for the opportunity to comment on the Notice of Preparation for The Ranch project. We have taken the opportunity to review the material gathered thus far and offer the following comments.

Aesthetics
Given that the Cordova Recreation and Parks District (the District) has not completed the programming for the community park, shown as Lot C on the tentative subdivision map, please evaluate the potential impacts from lighting potential sports fields at night. In particular, the impacts from the park onto the surrounding residential area.

Hazards and Hazardous Materials
While it is complementary to place the community park adjacent to the easement for the transmission lines to gather further open space, the impact of the transmission lines on park visitors should be evaluated. Please evaluate the impact of the electric and magnetic field radiation (EMF) from the transmission lines onto park users.

Hydrology and Water Quality
Constructed park facilities including programmed sport fields should be above the 100 year flood plain. The District does not accept Quimby park land encumbered with utility and storm drainage basins.

The project technical studies should demonstrate there will be adequate domestic water into the future sufficient to irrigate athletic fields and provide turf in both neighborhood and community parks as a public resource in perpetuity. The District will consider connection to alternative water sources in the future on a case by case basis consistent with new conservation and codes requirements.

Land Use
The District's adopted Level of Service (LOS) states that the required Quimby park land dedication is 5 acres/1000 residents. District Staff has previously indicated that the Quimby park land dedication

required for this project is 17.01 acres. Based upon the District's adopted Quimby park land allocation, The Ranch must provide 8.16 acres for neighborhood parks and 8.85 acres for the community park (with a 15 acre minimum preference).

The Ranch's Land Use Plan (Table 1) contained within the Notice of Preparation, indicates that the proposed project contains a total of 16.61 (net) acres to be parks. The proposed project includes 6.43 acres of neighborhood parkland and 10.18 acres of community park land, for a total of 16.61 acres. This is a deficiency of 0.40 acres to meet the project's Quimby Act requirement. The applicant will have to mitigate for the parkland deficiency. The District Staff have indicated that the neighborhood parkland requirement can be met with the private park facilities within the age-restricted & gated portion of the project, subject to approval by the CRPD board. The remaining acreage will be for a community park and must be dedicated to the Cordova Recreation and Park District.

The District does not accept Quimby park land encumbered with utility easements, storm drainage basins, wetlands and habitat areas that restrict development for recreational purposes. Where adjacencies of encumbered parcels exist the District is open to discussions about joint use agency programming and maintenance of encumbered parcels where adequate funding is provided in perpetuity.

Impacts of proposed parks on surrounding land uses should consider the full range of amenities that could be place on a park site as listed in Tables 3, 4 and 5 in the District's Cordova Recreation and Park District Park Impact Fee Nexus Study adopted April 8, 2014. Community Park facilities and District-wide facilities are eligible for placement in any community park.

Noise

Noise generated by the Park and Recreational Activities should be evaluated. In particular, the noise generated the sports activities in the community park onto the surrounding residential neighborhood and the outdoor activities taking place within the recreational center on Lot A onto those surrounding residences.

Traffic and Transportation

District standards state community parks should have street frontage on two sides where a high school property can substitute for one street and neighborhood parks have street frontage on three sides where elementary school property can be substituted for one street. The proposed project appears to meet this requirement.

Neighborhood park sites require on-street parking. Community park sites typically contain off-street parking but also benefit from the additional capacity provided by on-street parking.

Vehicular, pedestrian and multi-modal traffic impacts generated by park use should be evaluated, particularly for the Community Park. Placement of traffic signals and pedestrian crosswalks should be considered where community park facilities may generate significant volumes of traffic.

Soils

The Draft Environmental Impact Report (DEIR) should address the suitability of soil on proposed park sites to sustain active parks and the need to import fertile soils and/or provide soil amendments to meet District standards. The Geotechnical Engineering Report prepared for the development project should

include borings/test pits for park sites and provide discussion and recommendations relative to park site development.

The District appreciates the County's commitment to planning environmentally responsible and sustainable communities and we look forward to future engagement in this project. Please continue to forward documentation related to this project to the District. Please don't hesitate to contact me if you have any questions.

Sincerely,

Laura L. Taylor, ASLA

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, THE RANCH PROJECT, SCH# 2018072011, SACRAMENTO COUNTY

Pursuant to the State Clearinghouse's 6 July 2018 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environment Impact Report* for the Ranch Project, located in Sacramento County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases,

the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues.

For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/.

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Policy is available on page IV-15.01 at:
http://www.waterboards.ca.gov/centralvalleywater_issues/basin_plans/sacsjr.pdf

In part it states:

> *Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.*
>
> *This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.*

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Construction General Permit Order No. 2009-009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan

(SWPPP).

For more information on the Construction General Permit, visit the State Water Resources Control Board website at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml.

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]

The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process.

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/.

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Industrial Storm Water General Permit

Storm water discharges associated with industrial sites must comply with the regulations contained in the Industrial Storm Water General Permit Order No. 2014-0057-DWQ.

For more information on the Industrial Storm Water General Permit, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/index.shtml.

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACOE). If a Section 404 permit is required by the USACOE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements.

If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACOE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACOE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications.

Waste Discharge Requirements – Discharges to Waters of the State

If USACOE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation.

For more information on the Water Quality Certification and WDR processes, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/help/business_help/permit2.shtml.

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Risk General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Risk Waiver)
R5-2013-0145. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Risk General Order and the application process, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Risk Waiver and the application process, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2013-0145_res.pdf

Regulatory Compliance for Commercially Irrigated Agriculture

If the property will be used for commercial irrigated agricultural, the discharger will be required to obtain regulatory coverage under the Irrigated Lands Regulatory Program. There are two options to comply:

1. **Obtain Coverage Under a Coalition Group.** Join the local Coalition Group that supports land owners with the implementation of the Irrigated Lands Regulatory Program. The Coalition Group conducts water quality monitoring and reporting to the Central Valley Water Board on behalf of its growers. The Coalition Groups charge an annual membership fee, which varies by Coalition Group. To find the Coalition Group in your area, visit the Central Valley Water Board's website at: http://www.waterboards.ca.gov/centralvalley/water_issues/irrigated_lands/for_growers/apply_coalition_group/index.shtml or contact water board staff at (916) 464-4611 or via email at IrrLands@waterboards.ca.gov.

2. **Obtain Coverage Under the General Waste Discharge Requirements for Individual Growers, General Order R5-2013-0100**. Dischargers not participating in a third-party group (Coalition) are regulated individually. Depending on the specific site conditions, growers may be required to monitor runoff from their property, install monitoring wells, and submit a notice of intent, farm plan, and other action plans regarding their actions to comply with their General Order. Yearly costs would include State administrative fees (for example, annual fees for farm sizes from 10-100 acres are currently $1,084 + $6.70/Acre); the cost to prepare annual monitoring reports; and water quality monitoring costs. To enroll as an Individual Discharger under the Irrigated Lands Regulatory Program, call the Central Valley Water Board phone line at (916) 464-4611 or e-mail board staff at IrrLands@waterboards.ca.gov.

Low or Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Dewatering and Other Low Threat Discharges to Surface Waters* (Low Threat General Order) or the General Order for *Limited Threat Discharges of Treated/Untreated Groundwater from Cleanup Sites, Wastewater from Superchlorination Projects, and Other Limited Threat Wastewaters to Surface Water* (Limited Threat General Order). A complete application must be submitted to the Central Valley Water Board to obtain coverage under these General NPDES permits.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2013-0074.pdf

For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2013-0073.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit.

For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/help/business_help/permit3.shtml

If you have questions regarding these comments, please contact me at (916) 464-4644 or Stephanie.Tadlock@waterboards.ca.gov.

Subject: **Notice of Preparation of an Environmental Impact Report – The Ranch Project**
APN: **067-004-0008**

Dear Ms. Cowles,

The Sacramento Area Sewer District (SASD) and the Sacramento County Regional Sanitation District (Regional San) have reviewed the Notice of Preparation (NOP) of the Environmental Impact Report (EIR) for the subject project.

The project site consists of approximately 530 acres located in the City of Rancho Cordova city limits. The project site is bound by existing single-family residential uses and Douglas Road to the north, vacant land and Grant Line Road to the east, vacant land and Kiefer Boulevard to the south, and Rancho Cordova Parkway, single family residential, and vacant land on the west.

The objectives of the proposed project include development of the approximately 530 acre site with: 230.81 acres of residential units, 13.56 mixed use residential and commercial, 17.6 acres of parks and community facilities, 252.75 acres of open space, and 15.34 acres of roads.

The subject property is within the boundaries of SASD, Regional San, and the Urban Service Boundaries. The ultimate plan for conveyance and treatment of the subject property shall be by SASD's Sewer System Capacity Plan 2010 Update (SCP).

In order for SASD and Regional to more fully evaluate the subject project's impact on their systems, a sewer study will be needed. This study shall demonstrate the permanent connection(s) to SASD's and Regional San's system. The sewer study shall demonstrate the quantity of discharge and any "flow through sewage" along with appropriate pipe sizes and related appurtenances from this subject and other upstream areas and shall be done in accordance with SASDs' most recent "Minimum Sewer Study Requirements". The study shall be done on a no "Shed-Shift" basis unless approved by SASD in advance and in compliance with the SASD's Standards and Specifications.

We expect that if the project is subject to currently established policies, ordinances, fees, and to conditions of approval, then mitigation measures within the EIR will adequately address the sewage aspects of the project. We anticipate a less than significant impact to the sewage facilities due to mitigation as defined by the SCP.

Kelly and June,

Thanks for the opportunity to comment. I've reattached our response from February 2018 which included the original NOP comment letter from 2011. These comments still generally apply. Please let me know if you have any questions.

Thanks,

Matt

Subject: Notice of Preparation for The Ranch project

NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE RANCH PROJECT

LEAD AGENCY: City of Rancho Cordova Planning Department

June Cowles, (916) 851-8756

2729 Prospect Park Drive

Rancho Cordova, CA 95670

The City of Rancho Cordova (as Lead Agency, hereinafter City) intends to prepare an Environmental Impact Report (EIR) for The Ranch project (Project). In accordance with Section 15082 of the CEQA Guidelines, the City has prepared this Notice of Preparation (NOP) to provide responsible agencies and other interested parties with sufficient information describing the Project and its potential environmental effects.

The determination to prepare an EIR was made by the City following preliminary review of the Project. An Initial Study has been prepared, pursuant to CEQA Guidelines Section 15063, which identifies the anticipated environmental effects of the project. The Initial Study may be viewed at the City of Rancho Cordova City Hall, 2729 Prospect Park Drive; or via

the internet at http://www.cityofranchocordova.org/government/planning/environmental-review/environmental-documents.

Project Overview

The project is a 530-acre residential community, including approximately 1,375 single family residential units (including 689 age restricted units, up to 120 multifamily units, a 6 acre commercial parcel, a community clubhouse, a park and trail system, open space and supporting infrastructure.

Public Comment Opportunity

As specified by the CEQA Guidelines, the Notice of Preparation shall be circulated for a 30-day review period. The comment period runs from **Friday, July 6, 2018 to Monday, August 6, 2018**. The City welcomes public input during this review. In the event that no response or request for additional time is received by any responsible agency by the end of the review period, the Lead Agency may presume that the responsible agency has no response [CEQA Guidelines Section 15082(b(2)].

Comments may be submitted in person at the Scoping Meeting or in writing during the review period and addressed to:

City of Rancho Cordova

Planning Department

c/o June Cowles

2729 Prospect Park Drive

Rancho Cordova, CA 95670

A Scoping Meeting will be held on **Thursday, July 26, 2018 at 5:30 p.m.** in the Rancho Cordova City Hall, American River South Room, located at 2729 Prospect Park Drive, Rancho Cordova, CA.

Subject: RE: The Ranch GPA, RZ, TSM, DA, Phasing DD9725

Kelly,

Thanks for the email. I have a few comments. I see in our files we sent the attached comment letter on the NOP for the DEIR dated April 12, 2011 to the City. That's the last correspondence I see so I'm assuming this might have been on hold for a while. If I read the routing material correctly I see that a Traffic Impact Analysis was completed in 2017 by Kimley Horne and that an EIR will soon be prepared? I want to make sure the comments in the letter were incorporated into the traffic analysis. This project will most likely have impacts to existing and future county facilities along Grant Line Road and Sunrise Boulevard so I want to make sure those facilities were analyzed. Thanks for keeping us in the loop on this!

Thanks,

Matt

Good Afternoon,

Please find the attached project routing for your review. Completeness comments are due to June Cowles (jcowles@cityofranchocordova.org) by 5PM on March 2nd. Comments may be emailed but if we do not receive a response by March 2nd we will presume that your agency does not require any additional items to complete your review (i.e. additional studies, required items on plans, etc.).

Thank you,

Kelly

SUBJECT: COMMENTS FOR THE NOTICE OF PREPARATION OF THE DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE RANCH AT SUNRIDGE PROJECT

Dear Mr. Sampson:

The Sacramento County Department of Transportation (DOT) has reviewed the Notice of Preparation (NOP) of the Draft Environmental Impact Report (DEIR) for the Ranch at Sunridge project. We appreciate the opportunity to review the NOP and have the following comments to offer:

1. Please coordinate the scope of the traffic study with County DOT staff. Generally, the transportation impact analysis should at least evaluate weekday AM and PM peak hour conditions at intersections and daily roadway traffic conditions for roadway segments that are affected in the County. We would expect these would include facilities along Sunrise Boulevard, Grant Line Road, Kiefer Boulevard, Jackson Highway, Eagles Nest Road, Douglas Road, and White Rock Road at a minimum. In general, the County would like the traffic study to include the same intersections and roadway segments that were included in the original traffic study for the Sunridge Specific Plan.

2. County facilities should be analyzed according to Sacramento County Traffic Impact Analysis (TIA) guidelines dated July 2004. Prior to initiating the traffic impact study, please coordinate the study assumptions and any deviation from the County's TIA guidelines with County DOT staff.

3. Please make sure the land use assumptions that are contained in the transportation model are consistent with Easton, South Mather, and the Cordova Hills Specific Plans at a minimum.

4. Land use assumptions should be consistent with those outlined in the Folsom SOI. Please coordinate with the City of Folsom for project details.

5. Land use assumptions should be consistent with various major Quarry projects in Sacramento County (Teichert, Granite Construction and DeSilva Gates). Please coordinate any additional details regarding these projects with County DOT staff.

6. The DEIR should identify all impacted facilities in the County and provide feasible mitigation measures and identified funding sources. If impacts are found, we would request that the City of Rancho Cordova enter into an agreement with the County of Sacramento to implement these mitigation measures.

Should you have any questions, please feel free to contact me at (916) 874-7052. We look forward to providing any assistance necessary regarding this project.

Sincerely,

Matthew Darrow
Senior Transportation Engineer

RE: The Ranch Special Planning Area Notice of Preparation of a Draft Environmental Impact Report, and Project Routing for a Rezone, Development Agreement, and Tentative Subdivision Map

Dear Ms. Cowles,

The Sacramento Metropolitan Air Quality Management District (SMAQMD) thanks the City of Rancho Cordova for the opportunity to comment on the revised routing for the Ranch Special Planning Area project, and the Notice of Preparation under the California Environmental Quality Act (CEQA). We offer the following comments.

Because this project's size exceeds sizes specified in SMAQMD's screening tables, full CEQA analysis will be necessary for both construction and operational emissions. These emissions include both criteria pollutants (pollutants covered by state and federal clean air acts) and greenhouse gases (GHGs). SMAQMD's Guide to Air Quality Assessment in Sacramento County (CEQA Guide) provides methods to analyze project air quality and climate change impacts, including screening criteria, thresholds of significance, and more, to assist lead agencies in complying with CEQA.

If operational criteria pollutant emissions are determined to be significant, the City should require an air quality mitigation plan, consistent with General Plan Action AQ.1.2.3, to reduce operational emissions by at least 15%. We would be happy to work with the proponent on appropriate measures for the plan. We recommend SMAQMD verification of the plan prior to environmental document certification or tentative subdivision map approval, whichever occurs first.

If operational GHG emissions are determined to be significant, the City should apply all feasible mitigation, as described in SMAQMD's CEQA Guide. CEQA Guidelines Section 15183.5 includes the provision for tiering and streamlining the analysis of GHG emissions in CEQA documents. Under this provision, lead agencies may analyze and mitigate the effects of GHG emissions at a programmatic level, for example for a long range development plan such as the current Ranch Special Planning Area. Later project-specific CEQA documents may tier and/or incorporate by reference that existing programmatic review. SMAQMD's CEQA Guide includes guidance on programmatic CEQA review.

If the construction emissions of criteria pollutants and / or GHGs are determined to be significant, the City should require SMAQMD's standard construction mitigation. This mitigation is available in SMAQMD's CEQA Guide.

We look forward to receiving more project information through the environmental review process, so we can more fully evaluate this project for its effects on air quality. Please note that all projects are subject to SMAQMD rules and regulations in effect at the time of construction. The attached document describes SMAQMD rules which may apply to this project whether the air quality impacts are determined to be significant or not. If you have questions about these comments, please contact me at mwright@airquality.org or 916-874-4207.

Sincerely,

Molly Wright, AICP
Air Quality Planner / Analyst

Attachment: SMAQMD Rules and Regulations Statement

c: Paul Philley, AICP, Program Coordinator

Sac Metro Air District Rules & Regulations Statement (revised 6/2018)

*The following statement is recommended as standard condition of approval or construction document language for **all** development projects within the Sacramento Metropolitan Air Quality Management District (Sac Metro Air District):*

All projects are subject to Sac Metro Air District rules in effect at the time of construction. A complete listing of current rules is available at www.airquality.org or by calling 916-874-4800. Specific rules that may relate to construction activities or building design may include, but are not limited to:

Rule 201: General Permit Requirements. Any project that includes the use of equipment capable of releasing emissions to the atmosphere may require permit(s) from Sac Metro Air District prior to equipment operation. The applicant, developer, or operator of a project that includes an emergency generator, boiler, or heater should contact the Sac Metro Air District early to determine if a permit is required, and to begin the permit application process. Other general types of uses that require a permit include, but are not limited to, dry cleaners, gasoline stations, spray booths, and operations that generate airborne particulate emissions. Portable construction equipment (e.g. generators, compressors, pile drivers, lighting equipment, etc.) with an internal combustion engine over 50 horsepower is required to have a Sac Metro Air District permit or a California Air Resources Board portable equipment registration (PERP) (see Other Regulations below).

Rule 402: Nuisance. The developer or contractor is required to prevent dust or any emissions from onsite activities from causing injury, nuisance, or annoyance to the public.

Rule 403: Fugitive Dust. The developer or contractor is required to control dust emissions from earth moving activities, storage or any other construction activity to prevent airborne dust from leaving the project site.

Rule 414: Water Heaters, Boilers and Process Heaters Rated Less Than 1,000,000 BTU PER Hour. The developer or contractor is required to install water heaters (including residence water heaters), boilers or process heaters that comply with the emission limits specified in the rule.

Rule 417: Wood Burning Appliances. This rule prohibits the installation of any new, permanently installed, indoor or outdoor, uncontrolled fireplaces in new or existing developments.

Rule 442: Architectural Coatings. The developer or contractor is required to use coatings that comply with the volatile organic compound content limits specified in the rule.

Rule 453: Cutback and Emulsified Asphalt Paving Materials. This rule prohibits the use of certain types of cut back or emulsified asphalt for paving, road construction or road maintenance activities.

Rule 460: Adhesives and Sealants. The developer or contractor is required to use adhesives and sealants that comply with the volatile organic compound content limits specified in the rule.

Rule 902: Asbestos. The developer or contractor is required to notify the Sac Metro Air District of any regulated renovation or demolition activity. Rule 902 contains specific requirements for surveying, notification, removal, and disposal of asbestos containing material.

Other Regulations (California Code of Regulations (CCR))

17 CCR, Division 3, Chapter 1, Subchapter 7.5, §93105 Naturally Occurring Asbestos: The developer or contractor is required to notify the Sac Metro Air District of earth moving projects, greater than 1 acre in size in areas "Moderately Likely to Contain Asbestos" within eastern Sacramento County. The developer or contractor is required to comply with specific requirements for surveying, notification, and handling soil that contains naturally occurring asbestos.

13 CCR, Division 3, Chapter 9, Article 5, Portable Equipment Registration Program: The developer or contractor is required to comply with all registration and operational requirements of the portable equipment registration program such as recordkeeping and notification.

13 CCR, Division 3, Chapter 9, Article 4.8, §2449(d)(2) and 13 CCR, Division 3, Chapter 10, Article 1, §2485 regarding Anti-Idling: Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes. These apply to diesel powered off-road equipment and on-road vehicles, respectively.

Subject: Response to Notice of Preparation for The Ranch Project

Dear Ms. Cowles:

The Sacramento Municipal Utility District (SMUD) appreciates the opportunity to provide comments in response to the Notice of Preparation of a Draft Environmental Impact Report (DEIR) for The Ranch Project (Project). SMUD is the primary energy provider for the City of Rancho Cordova that includes the proposed Project area. SMUD's vision is to empower our customers with solutions and options that increase energy efficiency, protect the environment, reduce global warming, and lower the cost to serve our region. As a Responsible Agency, SMUD aims to ensure that the proposed Project limits the potential for significant environmental effects on SMUD facilities, employees, and customers.

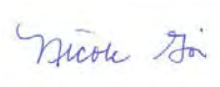
It is our desire that the DEIR that will be prepared for the Project acknowledge any Project impacts related to the following:

- Overhead and or underground transmission and distribution line easements. Please view the following links on smud.org for more information regarding transmission encroachment:
  - https://www.smud.org/en/Business-Solutions-and-Rebates/Design-and-Construction-Services
  - https://www.smud.org/en/Corporate/Do-Business-with-SMUD/Land-Use/Transmission-Right-of-Way
- Utility line routing
- Electrical load needs/requirements
- Energy Efficiency
- Climate Change
- Cumulative impacts related to the need for increased electrical delivery
- The new development can be served from existing and planned distribution substation facilities.
- SMUD has existing overhead 69kV within the transmission line corridor and along the west side of Rancho Cordova Pkwy.

- No new 69kV facilities are planned within the development.
- PUE will be required for all new 12kV within the development.
- A Consent to Common Use will be required through SMUD's Transmission and Real Estate Departments.

SMUD would like to be involved with discussing the above areas of interest as well as discussing any other potential issues. We aim to be partners in the efficient and sustainable delivery of the proposed Project. Please ensure that the information included in this response is conveyed to the Project planners and the appropriate Project proponents. Environmental leadership is a core value of SMUD and we look forward to collaborating with you on this Project. Again, we appreciate the opportunity to provide input on this NOP. If you have any questions regarding this letter, please contact SMUD's Environmental Management Specialist, Jerry Park, at jerry.park@smud.org or 916.732.7406.

Sincerely,



Nicole Goi

CalEEMod Parameters

Proposed Project (Operational) Scenario

- Project Location: Sacramento County
- Climate Zone: 6
- Land Use Setting: Urban
- Operational Year: **2035**
- Utility Company: Sacramento Municipal Utility District
- Land Uses:

Land Use Type and Subtype	Unit Amount and Metric	Lot Acreage	Square Footage	Population
Retail - Regional Shopping Center	32,000 sf	5.16	32,000	0
Residential - Apartments Mid-Rise (Multi-Family Residential)	215 units	7.17	215,000	621
Residential - Retirement Community (Active Adult Multi-Family Residential - attached)	38 units	1.26	38,000	78
Residential - Single-Family Residential (Traditional Single-Family Residential)	735 units	77.87	1,323,600	2,087
Residential - Retirement Community (Active Adult Single Family Residential - detached)	737 units	90.91	737,000	1,533
Recreational – City Park (Lot D – turf and play areas, and soccer field) (also includes 8,000 sf for restrooms)	9.1 acre – turf/play/fields 8,000 sf – restrooms	9.28	387,684	0
– Parking Other Asphalt Surface (Lot D – walking path)	1 acre	1	43,560	0
Parking – Parking Lot (Lot D)	0.5 acre	0.5	44,866.8	0
Recreational – City Park (Lot A – grass area) (also includes 21,000 sf for clubhouse and restrooms)	3.07 acres - turf, recreation 21,000 sf clubhouse	3.69	133,729	0
Parking – (Lot A, parking)	0.5 acres	0.5		
Parking – Other Asphalt Surfaces (open space lots, walking path)	2.5 acres	2.5	108,900	0
Parking – Parking Lot (open space lots	0.5	0.5		
Park (Lot C, Linear Tree and Natural Landscaping Feature))	0.5 acres – Park; 0.9 acres – passive uses (passive park uses are treated as open space and not modeled in CalEEMod)	1.4		
Park (Lot B, Community Garden)	1.58 – passive uses (passive park uses are treated as open space and	1.58		

	not modeled in CalEEMod)			
Park (Lot U, Passive Park))	1.21 (passive park uses are treated as open space and not modeled in CalEEMod)	1.21		
Subtotal		**204.53**		
Open Space (257.24 acres less 2.5 acres of paved/asphalt trails, 0.5 ac of parking)		254.24		
Roadways		71.33		
TOTAL		**530.1**		

Land Use data as provided by the project applicant.

Population = Population as calculated based on best available data. Consistent with what is provided in the Population and Housing section of the EIR (The population for non-age restricted single-family units were calculated using 2.84 persons per household. The population for non-age restricted multifamily units were calculated using 2.89 persons per household. The population for age-restricted single-family units were calculated using 2.08 persons per household. The population for age-restricted multifamily units was calculated using 2.05 person per household. All of these persons per household rates are from the 2013-2017 American Community Survey).

- Operational – Mobile:
  - Trip rates derived from the Traffic Analyses (Kimley Horn) (June 2019) (internal capture rate applied):
    - Apartments Mid-Rise: 5.36 trips/dwelling unit
    - Regional Shopping Center: 28.06 trips/dwelling unit
    - Retirement Community: 3.20 trips/dwelling unit (note – this is a weighted average of the two Retirement Community subtypes – attached and detached).
    - Single Family Housing: 8.7 trips/dwelling unit
  - Fleet Mix: Default CalEEMod values were used.
- Operational – Area
  - No woodstoves or fireplaces.
  - Consumer Products:
  - The "general category" emission factor was adjusted from default value (reduced by a total of 29.10%), based on the following differences between proposed project attributes and the inputs used to develop the default value (the default value utilizes statewide factors from year 2008):
    - The proposed project is estimated to have a persons per dwelling unit (persons/du) value of 2.504, versus the current statewide average of 2.971. This is a difference of 18.60%
    - The CARB estimated total statewide year 2016 ROG emissions of 208.71 tons/year, which is 12.89% less than the amount estimated for year 2008 (239.6 tons/year).
    - 3.5 out of the total 5.0 acres of parking lot – other asphalt surfaces modeled would be developed as walking paths.
  - Architectural Coatings:

[1] California Department of Finance, Table 2: E-5 City/County Population and Housing Estimates (1/1/2018).

        - The residential interior and non-residential interior emission factors were reduced from 100 g/L to 50 g/L, based on the SMAQMD Rule 442 that provides a maximum VOC limit of 50 g/L for flat coatings. It was assumed that flat coatings are used for interior coatings.

- Vegetation
    - Land Use Change: Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.87 - 90.91 - 7.17 - 5.16 - 32.3 - 20.59 - 17.34 = 278.76 acres of grassland remaining.
    - Approximately 2,240 new trees planted as part of the project (provided by project applicant). These were modeled as "miscellaneous" trees.

- Mitigation Measures (Operational) (Unmitigated):
    - Low Density Suburban (Project Setting)
    - Increase density to 6.86 dwelling units per acre;
    - Increase diversity;
    - Improve walkability design (123.53 intersections per square miles);
    - Improve destination accessibility (12.3 miles to downtown);
    - Increase transit accessibility (project site would include a bus/transit facilities – distance to transit for nearby residents would be approximately 0.25 miles);
    - Expand transit network (100% increase in coverage);
    - Provide traffic calming measures (50% of streets and intersections with improvements);
    - Improve pedestrian network (project site and connecting off-site);
    - Implement NEV network
    - Plant a minimum of 2,240 new trees throughout the project site;
    - No hearths.
    - Install energy efficient (i.e. LED) street lighting (for outdoor lighting);
    - Generate 95% or more of electricity via renewable energy (on-site energy generation and/or contract with SMUD);
    - Install energy efficient appliances;
    - Install low-flow appliances (bathroom faucet, kitchen faucet, toilet, and shower); and
    - Use water-efficient irrigation systems.
    - Turf Reduction: 70%

<u>Proposed Project (Operational – without car and light-duty truck trips) Scenario</u>
Note: all parameters are the same under this scenario as under the "Operational" scenario, except for the following:

- Operational – Mobile:
    - Trip rates derived from the Traffic Analyses (Kimley Horn) (June 2019) – modified to reflect the proportion of trips not due to cars or light-duty trucks (i.e. across-the-board reduction in trip rates by approximately 81.7%):
        - Apartments Mid-Rise: 0.98 trips/dwelling unit
        - Regional Shopping Center: 5.14 trips/dwelling unit
        - Retirement Community: 0.59 trips/dwelling unit
        - Single Family Housing: 1.59 trips/dwelling unit
    - Fleet Mix: Default CalEEMod values were used, except for car and light-duty truck fleet categories (LDA, LDT1, and LDT2). LDA, LDT1, and LDT2 trips were removed from the fleet

mix, and the remainder categories were reapportioned based on their relative size under the default scenario.

Proposed Project (Construction) Scenario – Phase 1

- Includes:
  - Phase I Clubhouse and associated landscaping (Lot A) – 1/3 of the building complex (about 7000 sf);
  - 270 single family residential units;
  - 232 single family residential units – age restricted.

Construction Tab – Phasing:

- Site Prep: 64 days (note: site prep for both phases 1 and 2)
  - 1/1/2020 – 3/30/2020
- Grading: 153 days
  - 4/1/2020 – 11/01/2020
- Paving: 65 days
  - 11/1/2020 – 1/30/2021
- Building Construction: 586 days
  - 2/1/2021 – 5/1/2023
- Architectural Coating: 587 days
  - 5/2/2021 – 8/1/2023

- Construction Tab – Off-Road Equipment:
  - Default CalEEMod values used.
- Construction Tab – Fleet Mix:
  - Default values used.

Proposed Project (Construction) Scenario – Phase 2

This phase includes the following:

- 197 single family residential units
- 210 single family residential units – age restricted.
- Neighborhood Park 2.2 ac (lot Q)
- Liner Park Lot C (1.4ac)
- Phase 2 Clubhouse building (~7000 sf) April 2023-June 2024

Construction Tab – Phasing:

- Improvements for Phase 2: 131 days
  - 4/1/2022 – 9/30/2022
- Paving: 65 days
  - 10/1/2022 – 12/31/2022
- Building Construction: 609 days
  - 4/1/2023 – 7/31/2025
- Architectural Coating: 609 days
  - 8/1/2023 – 11/30/2025

- Construction Tab – Off-Road Equipment:
  - Default CalEEMod values used.
- Construction Tab – Fleet Mix:
  - Default values used.

Proposed Project (Construction) Scenario – Phase 3

- This phase includes the following:
    - 268 single family residential units
    - 295 single family residential units – age restricted
    - 16 senior multi-family residential units
    - Open Space (Lot T) – 1.2 acres
    - Rancho Cordova Parkway Widening
    - Phase 3 clubhouse (~7000 sf) -April 2028-August 2029
    - Lot B (Park)

Construction Tab – Phasing:

- Site Prep: 43 days
    - 2/1/2025 – 4/27/2025
- Grading: 132 days
    - 4/28/2025 – 10/1/2025
- Paving: 65 days
    - 10/2/2025 – 12/31/2025
- Building Construction: 717 days
    - 1/1/2026 – 9/30/2028
- Architectural Coating: 718 days
    - 4/1/2026 – 12/31/2028
- Site Preparation and grading for Rancho Cordova widening: 196 days
    - 1/1/2027 – 10/1/2027
- Paving for Rancho Cordova widening: 86 days
    - 10/2/2027 – 01/31/2028
- Site Prep (note: for park – Lot D): 260 days
    - 4/1/2028 – 4/1/2029

- Construction Tab – Off-Road Equipment:
    - Default CalEEMod values used.
- Construction Tab – Fleet Mix:
    - Default values used.

Proposed Project (Construction) Scenario – Phase 4

- This phase includes the following:
    - 215 multi-family residential units
    - 22 senior multi-family residential units

Construction Tab – Phasing:

- Site Preparation for Commercial and MFR: 41 days
    - 3/1/2030 – 4/27/2030
- Grading and Improvements: 85 days
    - 4/28/2030 – 8/1/2030
- Paving: 65 days
    - 8/2/2030 – 10/31/2030
- Building Construction: 459 days
    - 4/1/2031 – 1/1/2033
- Architectural Coating: 108 days

        - 1/2/2033 – 6/1/2033
- Construction Tab – Off-Road Equipment:
    - Default CalEEMod values used.
- Construction Tab – Fleet Mix:
    - Default CalEEMod values used.

Proposed Project (Construction) Scenario – Phase 5

This phase includes the following:

- Commercial center.

Construction Tab – Phasing:

- Site Preparation for commercial center: 42 days
    - 3/1/2034 – 4/27/2034
- Grading and Improvements: 67 days
    - 4/28/2034 – 7/31/2024
- Paving: 24 days
    - 8/1/2034 – 9/1/2034
- Building Construction: 260 days
    - 10/1/2034 – 8/31/2035
- Architectural Coating: 86 days
    - 9/1/2035 – 12/31/2035

- Construction Tab – Off-Road Equipment:
    - Default CalEEMod values used.
- Construction Tab – Fleet Mix:
    - Default CalEEMod values used.

Proposed Project (Construction) Scenario – All Phases

Note: Site preparation and grading activities for Phases 1 and 2 are accounted for in Phase 1.

Construction Tab – Dust from Material Movement:

- Grading as modeled includes area for roadways, apportioned based on the acreages developed per construction phase. Grading for phases 1 and 2 would occur under phase 1 (per the Project Applicant).
- Cut and fill: net export of 152,708 cubic yards (CY) (prorated for phase 1 and 3 at 76,354 cubic yards for each phase).

Mitigation Measures (Construction):

- Water exposed area 2 time daily;
- Unpaved road mitigation = 15 mph;
- Clean paved road = 9% reduction.

The Ranch - City of Rancho Cordova (Construction Only - Phase 1)

Sacramento County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Single Family Housing	270.00	Dwelling Unit	28.61	486,000.00	767
Retirement Community	232.00	Dwelling Unit	28.62	232,000.00	463
City Park	1.02	Acre	1.23	44,576.40	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2035
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	590.31	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction state date of January 2020 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 1

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -
Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 148.53 (res./comm./right of way) this phase (includes phases 1 and 2). Assume 1/2 of site is exported during this this phase (152,708 CY / 2 = 76,354 CY). Total net export for entire project (152,708 CY) as provided by applicant.

Architectural Coating - Interior VOC limts reduced from 100 g/L to 50 g/L based on SMAQMD Rule 443 that provides a VOC limit for flat coatings of 50 g/L.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%. NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 1)

Sacramento County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Single Family Housing	270.00	Dwelling Unit	28.61	486,000.00	767
Retirement Community	232.00	Dwelling Unit	28.62	232,000.00	463
City Park	1.02	Acre	1.23	44,576.40	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2035
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	590.31	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction state date of January 2020 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 1

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -
Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 148.53 (res./comm./right of way) this phase (includes phases 1 and 2). Assume 1/2 of site is exported during this this phase (152,708 CY / 2 = 76,354 CY). Total net export for entire project (152,708 CY) as provided by applicant.

Architectural Coating - Interior VOC limts reduced from 100 g/L to 50 g/L based on SMAQMD Rule 443 that provides a VOC limit for flat coatings of 50 g/L.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%. NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction state date of January 2020 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 1

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -
Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 148.53 (res./comm./right of way) this phase (includes phases 1 and 2). Assume 1/2 of site is exported during this this phase (152,708 CY / 2 = 76,354 CY). Total net export for entire project (152,708 CY) as provided by applicant.

Architectural Coating - Interior VOC limts reduced from 100 g/L to 50 g/L based on SMAQMD Rule 443 that provides a VOC limit for flat coatings of 50 g/L.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%. NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

1.3 User Entered Comments & Non-Default Data

The Ranch - City of Rancho Cordova (Construction Only - Phase 2) - Sacramento County, Annual

Project Characteristics - Estimated construction state date of April 2022 for Phase 2 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 2

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - D

Trips and VMT - Default values.

Grading - No grading during Phase 2. Grading for phase 2 occured under Phase 1.

Architectural Coating - Interior VOC limts reduced from 100 g/L to 50 g/L based on SMAQMD Rule 443 that provides a VOC limit for flat coatings of 50 g/L.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust - Project will not have unpaved roads during the project's operational phase. Therefore, project does not use CARB Unmitigated Unpaved Road Statewide Emission Inventory Method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 2) - Sacramento County, Annual

1.3 User Entered Comments & Non-Default Data

The Ranch - City of Rancho Cordova (Construction Only - Phase 2) - Sacramento County, Summer

Project Characteristics - Estimated construction state date of April 2022 for Phase 2 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 2

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - D

Trips and VMT - Default values.

Grading - No grading during Phase 2. Grading for phase 2 occured under Phase 1.

Architectural Coating - Interior VOC limts reduced from 100 g/L to 50 g/L based on SMAQMD Rule 443 that provides a VOC limit for flat coatings of 50 g/L.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust - Project will not have unpaved roads during the project's operational phase. Therefore, project does not use CARB Unmitigated Unpaved Road Statewide Emission Inventory Method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 2) - Sacramento County, Summer

1.3 User Entered Comments & Non-Default Data

The Ranch - City of Rancho Cordova (Construction Only - Phase 2) - Sacramento County, Winter

Project Characteristics - Estimated construction state date of April 2022 for Phase 2 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 2

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment - D

Trips and VMT - Default values.

Grading - No grading during Phase 2. Grading for phase 2 occured under Phase 1.

Architectural Coating - Interior VOC limts reduced from 100 g/L to 50 g/L based on SMAQMD Rule 443 that provides a VOC limit for flat coatings of 50 g/L.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust - Project will not have unpaved roads during the project's operational phase. Therefore, project does not use CARB Unmitigated Unpaved Road Statewide Emission Inventory Method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 2) - Sacramento County, Winter

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction state date of February 2025 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 3

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the

applicant)
Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 104.38 acres graded (includes roadways). Assume 25,451 cy of material exported during this phase (total for all construction phases of 152,708 cy net export provided by applicant).

Architectural Coating -

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust - Project will not have unpaved roads during the project's operational phase. Therefore, project does not use CARB Unmitigated Unpaved Road Statewide Emission Inventory Method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction state date of February 2025 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 3

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the

applicant)
Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 104.38 acres graded (includes roadways). Assume 25,451 cy of material exported during this phase (total for all construction phases of 152,708 cy net export provided by applicant).

Architectural Coating -

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust - Project will not have unpaved roads during the project's operational phase. Therefore, project does not use CARB Unmitigated Unpaved Road Statewide Emission Inventory Method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction state date of February 2025 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 3

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the

applicant)
Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 104.38 acres graded (includes roadways). Assume 25,451 cy of material exported during this phase (total for all construction phases of 152,708 cy net export provided by applicant).

Architectural Coating -

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust - Project will not have unpaved roads during the project's operational phase. Therefore, project does not use CARB Unmitigated Unpaved Road Statewide Emission Inventory Method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 4)

Sacramento County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	215.00	Dwelling Unit	7.17	215,000.00	621
Retirement Community	22.00	Dwelling Unit	0.73	22,000.00	45

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2035
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	590.31	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction start date for Phase 4 of March 2030 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 4

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).
Grading - Assume 10.66 acres grading during this phase, based on project components to be built during this phase. Net export of cut and fill is 25,451 cy.

Architectural Coating - Assumes interior coatings use flat coatings.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating -

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 4)

Sacramento County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	215.00	Dwelling Unit	7.17	215,000.00	621
Retirement Community	22.00	Dwelling Unit	0.73	22,000.00	45

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2035
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	590.31	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction start date for Phase 4 of March 2030 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 4

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).
Grading - Assume 10.66 acres grading during this phase, based on project components to be built during this phase. Net export of cut and fill is 25,451 cy.

Architectural Coating - Assumes interior coatings use flat coatings.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating -

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

Sacramento County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	215.00	Dwelling Unit	7.17	215,000.00	621
Retirement Community	22.00	Dwelling Unit	0.73	22,000.00	45

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2035
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	590.31	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction start date for Phase 4 of March 2030 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 4

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).
Grading - Assume 10.66 acres grading during this phase, based on project components to be built during this phase. Net export of cut and fill is 25,451 cy.

Architectural Coating - Assumes interior coatings use flat coatings.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 28.33% - reflects project person/du value (2.523) vs. statewide avg. (2.97) and latest statewide data (ARB). Parking Degreaser EF red. by 57.5% (corrects for walking paths modeled as 'parking lot').

Area Coating -

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 5)

Sacramento County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Regional Shopping Center	32.00	1000sqft	5.16	32,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2035
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	590.31	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction start date for Phase 5 of March 2034 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 5

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 6.96 acres grading during this phase, based on project components to be built during this phase. Net export of cut and fill during this phase is 25,451 cy.

Architectural Coating - It was assumed that flat coatings are used for interior coatings.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products -

Area Coating -

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

The Ranch - City of Rancho Cordova (Construction Only - Phase 5)

Sacramento County, Summer

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Regional Shopping Center	32.00	1000sqft	5.16	32,000.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2035
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	590.31	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction start date for Phase 5 of March 2034 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 5

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

The Ranch - City of Rancho Cordova (Construction Only - Phase 5) - Sacramento County, Summer

Grading - Assume 6.96 acres grading during this phase, based on project components to be built during this phase. Net export of cut and fill during this phase is 25,451 cy.

Architectural Coating - It was assumed that flat coatings are used for interior coatings.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products -

Area Coating -

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Estimated construction start date for Phase 5 of March 2034 (provided by Applicant).

Land Use - This model run provides construction emissions only.

Construction Phase - Phase 5

Off-road Equipment -

Off-road Equipment - For building construction, assumes 1 crane, 2 forklifts, 1 generator set, 1 tractor/loader/backhoe, and 1 welder (as provided by the applicant)

Off-road Equipment -

Off-road Equipment - D

Off-road Equipment -

Trips and VMT - Assume grading truck haul length = 7 miles (Sacramento dump site).

Grading - Assume 6.96 acres grading during this phase, based on project components to be built during this phase. Net export of cut and fill during this phase is 25,451 cy.

Architectural Coating - It was assumed that flat coatings are used for interior coatings.

Vehicle Trips - Operational emissions not modeled under this scenario (construction only)

Road Dust -

Woodstoves - No fireplaces.

Consumer Products -

Area Coating -

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.57-92.01-5.08-0.65-30.40-21.18-18.41 = 284.80

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - Construction mitigation reflects quantification of the SMAQMD Basic Construction Emissions Control Practices: Water Exposed area 2x daily; Unpaved road mitigation = 15 mph; Clean paved road = 9%.

Mobile Land Use Mitigation -

Mobile Commute Mitigation -

Area Mitigation -

Energy Mitigation -

Water Mitigation -

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Buildout Year: 2029

Land Use - Land use info as provided by the unit counts/gross acres/sf provided by applicant. 8,000sf restroom is in the 9.1acre park. 21,000sf clubhouse/restroom is incl. in the 3.07ac city park. Pop. as provided in the Pop & Housing section of the EIR.

Construction Phase - Note - constructed not modeled under this (operational) scenario.

Off-road Equipment -

Trips and VMT -

Grading - Assumes whole project site is graded (except for protected areas) = 319.9 acres. 152,708 CY of material exported from project site (as provided by the Project Applicant).

Architectural Coating -

Vehicle Trips - Trip rates used from Traffic Impact Memo (June, 2019), inclusive of average internal capture rate the traffic consultant applied to AM and PM peak hours. Park trips are assumed to be accounted for by the land uses provided in the Traffic Impact Memo.

Road Dust - Project will not have unpaved roads during the project's operational phase. Since the project is in the SMAQMD jursidiction, project uses the CARB's 2.0 and 0.2 method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 29.1% - reflects project person/du value (2.504) vs. statewide avg. (2.97) and latest statewide data (ARB).

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.87 - 90.91 - 7.17 - 5.16 - 32.3 - 20.59 - 17.34 = 278.76 acres

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation - Density = ~6.86 du/acre. Increase walkability design (123.53 int/sq. mile). Improve ped network. Provide traffic calming (50%/50%). 100% increase in transit coverage (current coverage=0). Provide Transit Accessibility (0.25 mile)

Mobile Commute Mitigation -

Area Mitigation - No hearths are to be installed as part of the proposed project. Flat (i.e. non-reflective) paints are assumed for projects building interiors. (see SMAQMD Rule 442 - maximum VOC content for flat paints is 50 g/L).

Energy Mitigation - High-efficiency lighting (LEDs) (71.5% improvement). EE appliances. 95% electricity generated via renewables (on-site or SMUD contract).

Water Mitigation - Installation of low-floor indoor water use fixtures, and use of water-efficient irrigation systems (consistent with the current version of Title 24).

The Ranch - City of Rancho Cordova (Full Buildout - 2035 - Operational Only) Unmitigated - Sacramento County, Annual

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Buildout Year: 2029

Land Use - Land use info as provided by the unit counts/gross acres/sf provided by applicant. 8,000sf restroom is in the 9.1acre park. 21,000sf clubhouse/restroom is incl. in the 3.07ac city park. Pop. as provided in the Pop & Housing section of the EIR.

Construction Phase - Note - constructed not modeled under this (operational) scenario.

Off-road Equipment -

Trips and VMT -

Grading - Assumes whole project site is graded (except for protected areas) = 319.9 acres. 152,708 CY of material exported from project site (as provided by the Project Applicant).

Architectural Coating -

Vehicle Trips - Trip rates used from Traffic Impact Memo (June, 2019), inclusive of average internal capture rate the traffic consultant applied to AM and PM peak hours. Park trips are assumed to be accounted for by the land uses provided in the Traffic Impact Memo.

Road Dust - Project will not have unpaved roads during the project's operational phase. Since the project is in the SMAQMD jursidiction, project uses the CARB's 2.0 and 0.2 method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 29.1% - reflects project person/du value (2.504) vs. statewide avg. (2.97) and latest statewide data (ARB).

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.87 - 90.91 - 7.17 - 5.16 - 32.3 - 20.59 - 17.34 = 278.76 acres

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation - Density = ~6.86 du/acre. Increase walkability design (123.53 int/sq. mile). Improve ped network. Provide traffic calming (50%/50%). 100% increase in transit coverage (current coverage=0). Provide Transit Accessibility (0.25 mile)

Mobile Commute Mitigation -

Area Mitigation - No hearths are to be installed as part of the proposed project. Flat (i.e. non-reflective) paints are assumed for projects building interiors. (see SMAQMD Rule 442 - maximum VOC content for flat paints is 50 g/L).

Energy Mitigation - High-efficiency lighting (LEDs) (71.5% improvement). EE appliances. 95% electricity generated via renewables (on-site or SMUD contract).

Water Mitigation - Installation of low-floor indoor water use fixtures, and use of water-efficient irrigation systems (consistent with the current version of Title 24).

The Ranch - City of Rancho Cordova (Full Buildout - 2035 - Operational Only) Unmitigated - Sacramento County, Summer

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Buildout Year: 2029

Land Use - Land use info as provided by the unit counts/gross acres/sf provided by applicant. 8,000sf restroom is in the 9.1acre park. 21,000sf clubhouse/restroom is incl. in the 3.07ac city park. Pop. as provided in the Pop & Housing section of the EIR.

Construction Phase - Note - constructed not modeled under this (operational) scenario.

Off-road Equipment -

Trips and VMT -

Grading - Assumes whole project site is graded (except for protected areas) = 319.9 acres. 152,708 CY of material exported from project site (as provided by the Project Applicant).

Architectural Coating -

Vehicle Trips - Trip rates used from Traffic Impact Memo (June, 2019), inclusive of average internal capture rate the traffic consultant applied to AM and PM peak hours. Park trips are assumed to be accounted for by the land uses provided in the Traffic Impact Memo.

Road Dust - Project will not have unpaved roads during the project's operational phase. Since the project is in the SMAQMD jursidiction, project uses the CARB's 2.0 and 0.2 method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 29.1% - reflects project person/du value (2.504) vs. statewide avg. (2.97) and latest statewide data (ARB).

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.87 - 90.91 - 7.17 - 5.16 - 32.3 - 20.59 - 17.34 = 278.76 acres

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation - Density = ~6.86 du/acre. Increase walkability design (123.53 int/sq. mile). Improve ped network. Provide traffic calming (50%/50%). 100% increase in transit coverage (current coverage=0). Provide Transit Accessibility (0.25 mile)

Mobile Commute Mitigation -

Area Mitigation - No hearths are to be installed as part of the proposed project. Flat (i.e. non-reflective) paints are assumed for projects building interiors. (see SMAQMD Rule 442 - maximum VOC content for flat paints is 50 g/L).

Energy Mitigation - High-efficiency lighting (LEDs) (71.5% improvement). EE appliances. 95% electricity generated via renewables (on-site or SMUD contract).

Water Mitigation - Installation of low-floor indoor water use fixtures, and use of water-efficient irrigation systems (consistent with the current version of Title 24).

The Ranch - City of Rancho Cordova (Full Buildout - 2035 - Operational Only) Unmitigated - Sacramento County, Winter

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Buildout Year: 2035

Land Use - Land use info as provided by the unit counts/gross acres/sf provided by applicant. 8,000sf restroom is in the 9.1acre park. 21,000sf clubhouse/restroom is incl. in the 3.07ac city park. Pop. as provided in the Pop & Housing section of the EIR.

Construction Phase - Note - constructed not modeled under this (operational) scenario.

Off-road Equipment -

Trips and VMT -

Grading - Assumes whole project site is graded (except for protected areas) = 319.9 acres. 152,708 CY of material exported from project site (as provided by the Project Applicant).

Architectural Coating -

Vehicle Trips - Trip rates used from Traffic Impact Memo (June, 2019), inclusive of average internal capture rate the traffic consultant applied to AM and PM peak hours. Park trips are assumed to be accounted for by the land uses provided in the Traffic Impact Memo.

Road Dust - Project will not have unpaved roads during the project's operational phase. Since the project is in the SMAQMD jursidiction, project uses the CARB's 2.0 and 0.2 method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 29.1% - reflects project person/du value (2.504) vs. statewide avg. (2.97) and latest statewide data (ARB).

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.87 - 90.91 - 7.17 - 5.16 - 32.3 - 20.59 - 17.34 = 278.76 acres

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation - Density = ~6.86 du/acre. Increase walkability design (123.53 int/sq. mile). Improve ped network. Provide traffic calming (50%/50%). 100% increase in transit coverage (current coverage=0). Provide Transit Accessibility (0.25 mile)

Mobile Commute Mitigation - Mitigation: Implement Trip Reduction Program (100% employee eligilbe; voluntary).

Area Mitigation - No hearths are to be installed as part of the proposed project. Flat (i.e. non-reflective) paints are assumed for projects building interiors. (see SMAQMD Rule 442 - maximum VOC content for flat paints is 50 g/L).

Energy Mitigation - High-efficiency lighting (LEDs) (71.5% improvement). EE appliances. 95% electricity generated via renewables (on-site or SMUD contract). Mitigation: Exceed Title 24 by 2%.

Water Mitigation - Install low-floor indoor water use fixtures, and use water-efficient irrigation systems (=current version of Title 24). Mitigation: Apply water conservation strategy (50% native or drought-resistant trees outdoors - assume 25% reduction outdoor).

Fleet Mix -

The Ranch - City of Rancho Cordova (Full Buildout - 2035 - Operational Only) Mitigated - Sacramento County, Annual

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network

Expand Transit Network

Implement Trip Reduction Program

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Buildout Year: 2035

Land Use - Land use info as provided by the unit counts/gross acres/sf provided by applicant. 8,000sf restroom is in the 9.1acre park. 21,000sf clubhouse/restroom is incl. in the 3.07ac city park. Pop. as provided in the Pop & Housing section of the EIR.

Construction Phase - Note - constructed not modeled under this (operational) scenario.

Off-road Equipment -

Trips and VMT -

Grading - Assumes whole project site is graded (except for protected areas) = 319.9 acres. 152,708 CY of material exported from project site (as provided by the Project Applicant).

Architectural Coating -

Vehicle Trips - Trip rates used from Traffic Impact Memo (June, 2019), inclusive of average internal capture rate the traffic consultant applied to AM and PM peak hours. Park trips are assumed to be accounted for by the land uses provided in the Traffic Impact Memo.

Road Dust - Project will not have unpaved roads during the project's operational phase. Since the project is in the SMAQMD jursidiction, project uses the CARB's 2.0 and 0.2 method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 29.1% - reflects project person/du value (2.504) vs. statewide avg. (2.97) and latest statewide data (ARB).

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.87 - 90.91 - 7.17 - 5.16 - 32.3 - 20.59 - 17.34 = 278.76 acres

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation - Density = ~6.86 du/acre. Increase walkability design (123.53 int/sq. mile). Improve ped network. Provide traffic calming (50%/50%). 100% increase in transit coverage (current coverage=0). Provide Transit Accessibility (0.25 mile)

Mobile Commute Mitigation -

Area Mitigation - No hearths are to be installed as part of the proposed project. Flat (i.e. non-reflective) paints are assumed for projects building interiors. (see SMAQMD Rule 442 - maximum VOC content for flat paints is 50 g/L).

Energy Mitigation - High-efficiency lighting (LEDs) (71.5% improvement). EE appliances. 95% electricity generated via renewables (on-site or SMUD contract).

Water Mitigation - Installation of low-floor indoor water use fixtures, and use of water-efficient irrigation systems (consistent with the current version of Title 24).

Fleet Mix - Adjusted to account for the removal of passenger and light duty trucks for operational GHG emissions, per SB 375.

4.0 Operational Detail - Mobile

4.1 Mitigation Measures Mobile

Increase Density

Increase Diversity

Improve Walkability Design

Improve Destination Accessibility

Increase Transit Accessibility

Improve Pedestrian Network

Provide Traffic Calming Measures

Implement NEV Network

Expand Transit Network

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Buildout Year: 2035

Land Use - Land use info as provided by the unit counts/gross acres/sf provided by applicant. 8,000sf restroom is in the 9.1acre park. 21,000sf clubhouse/restroom is incl. in the 3.07ac city park. Pop. as provided in the Pop & Housing section of the EIR.

Construction Phase - Note - constructed not modeled under this (operational) scenario.

Off-road Equipment -

Trips and VMT -

Grading - Assumes whole project site is graded (except for protected areas) = 319.9 acres. 152,708 CY of material exported from project site (as provided by the Project Applicant).

Architectural Coating -

Vehicle Trips - Trip rates used from Traffic Impact Memo (June, 2019), inclusive of average internal capture rate the traffic consultant applied to AM and PM peak hours. Park trips are assumed to be accounted for by the land uses provided in the Traffic Impact Memo.

Road Dust - Project will not have unpaved roads during the project's operational phase. Since the project is in the SMAQMD jursidiction, project uses the CARB's 2.0 and 0.2 method (per CalEEMod User Guidebook).

Woodstoves - No fireplaces.

Consumer Products - 'General Category' consumer products EF red. by 29.1% - reflects project person/du value (2.504) vs. statewide avg. (2.97) and latest statewide data (ARB).

Area Coating - Maximum 50 g/l for flat coatings SMAQMD Rule 442. Assume flat coatings are used for interior coatings.

Landscape Equipment -

Energy Use -

Land Use Change - Assumes residential, commercial, and right-of-way are converted from grassland. Total acres = 530.1 - 77.87 - 90.91 - 7.17 - 5.16 - 32.3 - 20.59 - 17.34 = 278.76 acres

Sequestration - Approximately 2,240 new trees planted as part of the project (provided by project applicant).

Construction Off-road Equipment Mitigation - NOTE: This model run reflects operational emissions only.

Mobile Land Use Mitigation - Density = ~6.86 du/acre. Increase walkability design (123.53 int/sq. mile). Improve ped network. Provide traffic calming (50%/50%). 100% increase in transit coverage (current coverage=0). Provide Transit Accessibility (0.25 mile)

Mobile Commute Mitigation - Mitigation: Implement Trip Reduction Program (100% employee eligilbe; voluntary).

Area Mitigation - No hearths are to be installed as part of the proposed project. Flat (i.e. non-reflective) paints are assumed for projects building interiors. (see SMAQMD Rule 442 - maximum VOC content for flat paints is 50 g/L).

Energy Mitigation - High-efficiency lighting (LEDs) (71.5% improvement). EE appliances. 95% electricity generated via renewables (on-site or SMUD contract). Mitigation: Exceed Title 24 by 2%.

Water Mitigation - Install low-floor indoor water use fixtures, and use water-efficient irrigation systems (=current version of Title 24). Mitigation: Apply water conservation strategy (50% native or drought-resistant trees outdoors - assume 25% reduction outdoor).

Fleet Mix - Mobile vehicle trips updated to remove passenger cars and light-duty trucks, per SB 375.

The Ranch (Full Buildout - 2035 - Operational Only - without passenger vehicles_mitigated - Sacramento County, Annual

APPENDIX B.3

Determination of MTP/SCS Consistency Worksheet

DETERMINATION OF MTP/SCS CONSISTENCY WORKSHEET
For Qualifying Transit Priority Projects and Residential/Mixed-Use Residential Projects

As of February 20, 2018[i]

Background: Pursuant to SB 375, streamlined CEQA review and analysis is available to Transit Priority Projects (TPPs) and residential or mixed-use residential projects that are consistent with the SCS. The SCS was adopted by the Sacramento Area Council of Governments (SACOG) Board as part of the 2016 Metropolitan Transportation Plan/Sustainable Communities Strategy on February 18, 2016. The California Air Resources Board (CARB) provided an Acceptance of GHG Quantification Determination for the SACOG SCS in September 2016.

Streamlined CEQA review available to TPPs consists of one of the following: 1) a Sustainable Communities Environmental Assessment (SCEA) pursuant to Public Resources Code (PRC) § 21155.2(b) or 2) an EIR pursuant to PRC § 21155.2(c).[ii]

Streamlined CEQA review available to residential or mixed-use residential projects consists of an EIR pursuant to PRC § 21159.28(a).

Purpose: The purpose of this worksheet is to provide lead agencies with assistance on three issues:

1. Whether a proposed project qualifies as a TPP;
2. Whether a proposed project qualifies as a residential or mixed-use residential project (at least 75 percent of the total building square footage is residential);
3. Whether the TPP or residential/mixed-use residential project is consistent with the general land use designation, density, intensity and applicable policies of the 2016 MTP/SCS adopted by the Sacramento Area Council of Governments (SACOG).

The lead agency has responsibility to make the final determination on these matters and to determine the applicable and appropriate CEQA streamlining, if any.

Directions: This worksheet should be completed by the lead agency, relying on the project description of the proposed project, MTP/SCS Chapters 3 and 4, and MTP/SCS Appendix E-3. Regardless of whether this worksheet is used, pursuant to PRC § 21155(a) and PRC § 21159.28(a), a project can only be consistent with the MTP/SCS if it is consistent with the general land use designation, density, building intensity, and applicable policies specified for the project area in the adopted SCS. This worksheet only applies to the 2016 MTP/SCS (adopted February 18, 2016); subsequent MTP/SCS adoptions may require updates to this form.

Lead agencies are welcome to contact SACOG for assistance in completing this worksheet. For assistance, contact Kacey Lizon at klizon@sacog.org or 916-340-6265.

Project Title: The Ranch

Proposed project is located in (city/county name): City of Rancho Cordova

1. Transit Priority Project Designation (PRC § 21155(b))

A project must meet the requirements of items **1.A, 1.B, 1.C, and 1.D,** below, to qualify as a Transit Priority Project. **For items 1.C and 1.D**, the definition of an MTP/SCS Transit Priority Area is: the area within one-half mile of a rail station stop or a high-quality transit corridor included in the MTP/SCS. A high-quality transit corridor has fixed route bus service with service intervals of 15 minutes or less during peak commute hours. See MTP/SCS Chapter 3 for the map of Transit Priority Areas.

1.A. [ ] The Project has a minimum net density[iii] of 20 dwelling units per acre.

Calculation:

Total housing units proposed in Project ___÷ Total Project parcel area (in net[ii] acres)___

= _____ (Should be ≥20 du/ac)

1.B. [ ] At least 50 percent of the Project's total building square footage is in residential use, **AND**,

[ ] The total building square footage of the Project has 25 percent or less non-residential use, or, if it has between 26 and 50 percent in non-residential use, has a minimum FAR of 0.75.

Calculations:

Total Project residential square footage ____÷ Total Project building square footage__
= _____ (Should be ≥ 50%)

Total Project building square footage___÷ Total Project parcel(s) area square footage__
= _____(Should be ≥ 0.75)

1.C. [ ] The Project is located within an MTP/SCS Transit Priority Area and the qualifying transit service is *(transit route name/applicable street name/number or light rail stop name as identified in the adopted MTP/SCS)*: _____

1.D. [ ] No more than 25 percent of the area of the Project parcels are farther than one-half mile from the TPA transit stop/corridor and no more than 10 percent of the residential units or 100 units, whichever is less, in the project are farther than one-half mile from the TPA transit stop/corridor.

Calculations:

Project area outside of ½ mile TPA _____ ÷ Total Project area _____ = _____ (Should be ≤ 25%)

Project residential units outside of ½ mile TPA _____ ÷ Total Project units _____ = _____ (Should be ≤ 10% or less than 100 units)

SECTION 1 CONCLUSION:

[ ] The proposed project meets the requirements of 1.A, 1.B, 1.C, and 1.D and therefore qualifies as a Transit Priority Project.

[ ] The proposed project does not meet all the requirements of 1.A, 1.B, 1.C, and 1.D and therefore does not qualify as a Transit Priority Project.

2. Residential or Mixed-Use Residential Project Designation for Projects Located Outside of an MTP/SCS TPA 21159.28(a)

A residential or mixed-use residential project using the streamlined CEQA review to complete an EIR pursuant to PRC § 21159.28(a) must meet the following requirement:

2.A. [x] At least 75 percent of the total building square footage of the project consists of residential use.

Calculation:

Total Project residential square footage approx. 2,875,800 ÷ Total Project building square footage is approx. 2,934,800 = 98% (Should be ≥ 75%)

SECTION 2 CONCLUSION:

[x] The proposed project meets the requirements of 2.A and therefore qualifies as a residential or mixed-use residential project.

[ ] The proposed project does not meet the requirements of 2.A and therefore does not qualify as a residential or mixed-use residential project.

IF A PROJECT DOES NOT QUALIFY AS EITHER A TRANSIT PRIORITY PROJECT (UNDER SECTION 1) OR A RESIDENTIAL OR MIXED-USE RESIDENTIAL PROJECT (UNDER SECTION

2), THE PROJECT DOES NOT QUALIFY FOR SB 375 CEQA STREAMLINING. DO NOT PROCEED TO SECTION 3.

3. Required Consistency with the SCS: General Use Designation, Density and Intensity, and Applicable MTP/SCS Policies (PRC § 21155(a) and PRC § 21159.28(a))

3.A. Applicable MTP/SCS Policies. For the purposes of determining SCS consistency, the policies of the MTP/SCS are embedded in the metrics and growth forecast assumptions of the MTP/SCS. Projects consistent with the growth forecast assumptions of the MTP/SCS, as determined by application of items 3.B. and 3.C, are consistent with the MTP/SCS and its policies.

3.B. Applicable Community Type. The MTP/SCS land use forecast is illustrated using Community Types. In order to determine the general use designation, density and intensity of the Project area within the MTP/SCS, the Project must be located within a Community Type designated in the MTP/SCS. The MTP/SCS defines density/building intensity in terms of the amount of growth (residential and non-residential) forecasted and the amount of build out potential within each Community Type area. SACOG monitors development activity on an annual basis to check that the amount of development is consistent with the growth forecast of the MTP/SCS.

For the purposes of the lead agency's determination of SCS consistency, use MTP/SCS Appendix E-3 to identify the Community Type for the Project and fill in the applicable information, below for 3.B.1 and 3.B.2.

3.B.1. The Project is located in the following Community Type:

[ ] Center and Corridor Community

[ ] Established Community

[x] Developing Community *(list the specific name of the Developing Community as identified in the jurisdiction narrative in Appendix E-3)*: Ranch at Sunridge

[ ] Rural Residential Community

3.B.2 [x] Development from the project when added to other entitled projects will not exceed the MTP/SCS build out assumptions for the area within this Community Type, which is 152,027 new housing units and 81,837 new employees[iv].

3.C. General Use Designation, Density and Building Intensity. The foundation of the land use designations for the MTP/SCS is adopted and proposed local general plans, community plans, specific plans and other local policies and regulations. A project is consistent with the MTP/SCS if its uses are identified in the applicable MTP/SCS Community Type **and** its uses meet the general density and building intensity assumptions for the Community Type. The proposed project does not have to include all allowed uses in the MTP/SCS.

3.C.1. Determine consistency of the Project using one of the methods below:

Option A:

[ ] The Project is located in a **Center and Corridor Community or an Established Community** and the Project uses are consistent with the allowed uses of the applicable adopted local land use plan as it existed in 2012 and are at least 80 percent of the maximum allowed density or intensity of the allowed uses of the applicable local land use plans. Therefore, the Project is consistent with the MTP/SCS.[v]

OR

Option B:

[ ] The Project is located in a **Center and Corridor Community or an Established Community** and the Project uses have been reviewed in the context of, and are found to be consistent with, the general land use, density, and intensity information provided for this Community Type in Appendix E-3 of the MTP/SCS. Therefore, the Project is consistent with the MTP/SCS.

OR

Option C:

[ ] The Project is located in a **Rural Residential Community** and the Project residential density does not exceed the maximum density of one unit per acre as specified in the MTP/SCS, and employment development in the Project is at least 80 percent of the maximum allowed density or intensity of the applicable local land use plans. Therefore, the Project is consistent with the MTP/SCS.

OR

Option D:

[x] The Project is located in a **Developing Community** and the Project's average net density meets or exceed the average net density described for this specific

Developing Community (as referenced by name of applicable specific plan, master plan, or special plan in MTP/SCS Appendix E-3) and employment development in the Project is consistent with the general employment land uses described for this specific Developing Community.[vi] Therefore, the Project is consistent with the MTP/SCS.

SECTION 3 CONCLUSION:

The proposed project is consistent with the General Use Designation, Density and Intensity, and Applicable MTP/SCS Policies for the following reasons (*summarize findings on use designation, density and intensity for the Project evaluation completed in Section 3)*:

The proposed project (the "Ranch at Sunridge" in the MTP/SCS) is consistent with the general uses envisioned for the site in the MTP/SCS. The proposed average net residential density (7 units/acre) is consistent with the average net density of 7 units/acre described for the the Ranch at Sunridge (MTP/SCS Appendix E-3, p. 137); total residential development is less than initial plans for the site due to significant preservation of open space and wetland resources which is consistent with the environmental principles of the SCS. Employment-generating uses include the proposed senior congregate care use, senior clubhouse, commercial parcel, multi-family residential parcel, and parks and recreation uses, are consistent with the commercial and public uses envisioned by the MTP/SCS (sMTP/SCS Appendix E-3, p. 137). A Special Planning Area (SPA) Handbook has been prepared for the proposed project, which acts in a similar capacity to a Specific Plan, and is consistent with the MTP/SCS. The project is consistent with the goals of, the City of Rancho Cordova General Plan (see SPA Handbook for further detail). The project provides for a high level of bicycle and pedestrian connectivity throughout the project site, including non-auto connections to the parks, open space, and trails features of the project. An open space and wetland preserve area is provided, preserving wetlands and aquatic resources on the site. A range of housing types (including single family market rate and senior units at a range of densities and lot sizes, senior congregate care units, and multifamily units) will serve a broad spectrum of households. As described in the Draft EIR, comprehensive features and measures are provided to reduce GHG emissions, including use of renewable energy for the residential component of the project, an EV charging network, and use of energy-efficient and water-conserving building and design practices. The project does not conflict with the MTP/SCS.

[i] This document may be updated as users provide feedback on its utility.

[ii] If a TPP complies with an additional series of requirements set forth in PRC § 21155.1, it qualifies as a Sustainable Communities Project and becomes eligible for a complete exemption from CEQA. This worksheet does not address Sustainable Communities Projects.

[iii] *Net density* is not defined in PRC §2115(b). In the MTP/SCS, net density is defined as follows: Housing units divided by the acres on which housing is built, exclusive of public rights-of-ways, parks, schools and public areas (MTP/SCS Appendix E-3).

[iv] The MTP/SCS build out for each Community Type assumes development that is entitled as of January 1, 2012. SACOG monitors housing permits on an annual basis and will ensure that housing and employment projects relying on the SB 375 CEQA benefits will not exceed the capacity assumed in the MTP/SCS. SACOG undertakes this review generally every four years as part of the update of the MTP/SCS. In between MTP/SCS updates, projects that exceed the build out of a Community Type in a jurisdiction can be reviewed for consistency by SACOG and will be evaluated on a project by project basis.

[v] The MTP/SCS general land use, density and intensity in Center and Corridor Communities and Established Communities is based on 80 percent of the maximum allowed density or intensity of the land use designations in applicable local land use plans as they existed in 2012, unless otherwise noted in Appendix E-3.

[vi] The MTP/SCS land use forecast in Developing Communities was modeled according to adopted and proposed specific plans, master plans, and special plans as they existed in 2012, and is based on the housing and employment totals and the average net density of these plans, as outlined in Appendix E-3.

APPENDIX B.4

Analysis of Models and Tools to Correlate Project-Generated Pollutants to Health End Points

ANALYSIS OF MODELS AND TOOLS TO CORRELATE PROJECT-GENERATED CRITERIA POLLUTANT EMISSIONS TO HEALTH END POINTS

TOOL	*CREATED BY*	*DESCRIPTION*	*RESOLUTION*	*POLLUTANTS ANALYZED*	*PROJECT-LEVEL CEQA APPLICABILITY*
AERMOD Modeling System[1,2]	AERMIC	A steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. The modeling system incorporates air dispersion based on a planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain.	Project-level	SO_2, ROG, NO_2, Lead, $PM_{2.5}$, $PM_{10,}$ NH_3	This model operates at the project-level and provides air dispersion modeling of a project's pollutant emissions on the surrounding environment. However, even with supplementary (i.e. additional) software, such as the California Air Resource Board's Hotspots Analysis and Reporting Program (HARP), the model does not estimate specific health effects on receptors from the air dispersion modeling (that is, it is not scientifically feasible to infer individualized health effects on receptors from the pollutant concentrations identified by this model, even in conjunction with other software such as HARP). Moreover, concentration modeling of ozone is not possible with AERMOD (nor any other known model used in conjunction with AERMOD), due to the complex nature of pollution concentration formation and numerous regional influences (multiple emission sources, meteorology, atmospheric chemistry and geography). Therefore, this model is not recommended for correlating project-generated criteria pollutant emissions to health end points.
AirCounts[3]	Abt Assoc.	Online tool that helps large and medium-sized cities quickly estimate the health benefits of $PM_{2.5}$ emission reductions and economic value of those benefits. The tool estimates the number of deaths (mortality) avoided and economic value related to user-specified regional, annual $PM_{2.5}$ emissions reduction.	City-level	Primary $PM_{2.5}$	This tool is only illustrative, as it is limited to certain cities and does not target specific sectors. The tool is not sector-specific, and includes limited California data. It cannot provide results at a development project level. Therefore, the tool is not recommended for project-level CEQA analysis.
Air Pollution Emission Experiments and Policy analysis	Mueller and Mendelsohn 2006, 2009	The Air Pollution Emission Experiments and Policy (APEEP) analysis model (Muller and Mendelsohn 2006, 2009) is a traditional integrated assessment model. Like other integrated assessment models, APEEP connects emissions of air pollution through air-quality modeling to exposures, physical effects, and monetary damages.	National or county-level	SO_2, ROG, NO_x, Ozone, $PM_{2.5}$, PM_{10}	The model operates at the national scale but may be applied at the county-level (although it is not clear how this adjustment should be made). It cannot provide results at a development project-level. The tool is also not commercially available. Therefore, the tool is not recommended for project-level CEQA

[1] See: https://www.epa.gov/scram/air-quality-dispersion-modeling-preferred-and-recommended-models

[2] Note: May require additional software to estimate the level of each specific pollutant at the modeled receptors.

[3] See: https://www.abtassociates.com/tools

Tool	*Created by*	*Description*	*Resolution*	*Pollutants Analyzed*	*Project-level CEQA Applicability*
(APEEP) model[4]		Making these links requires the use of findings reported in the peer-reviewed literature across several scientific disciplines. The air-quality models in APEEP use the emission data provided by EPA to estimate corresponding ambient concentrations in each county in the coterminous states.			analysis.
California Emissions Estimator Model® (CalEEMod)	California Air Pollution Control Officers Association (CAPCOA)	CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects.	Project-level	SO_2, ROG, NOx, CO, GHGs, $PM_{2.5}$, PM_{10}	Although CalEEMod is useful in comparing a project's emissions to significance thresholds, it is not able to assess transport of pollutants or the impacts of external factors (weather, terrain, etc.) on pollutant concentrations at particular locations. Therefore, this model is not recommended for estimating the health effects of project-generated criteria pollutants.
CALINE3/ CAL3QHC/ CAL3QHCR[1, 2]	United States Environmental Protection Agency (USEPA)	A steady-state Gaussian dispersion model designed to determine air pollution concentrations at receptor locations downwind of highways located in relatively uncomplicated terrain. CALINE3 is incorporated into the more refined CAL3QHC and CAL3QHCR models. CAL3QHCR is a more refined version based on CAL3QHC that requires local meteorological data.	Project-level	SO_2, ROG, NO_2, Lead, $PM_{2.5}$, PM_{10}	This model operates at the project level and provides air dispersion modeling for a project's transportation emissions on the surrounding environment. However, even with supplementary (i.e. additional software), the model cannot estimate specific health effects on receptors from the air dispersion modeling. Moreover, it cannot model the (complex) chemical reactions that occur between the ozone precursors (e.g. NOx and ROG) that generate ozone. Therefore, this model is not recommended for correlating project-generated criteria pollutant emissions to health end points.
Complex Terrain Dispersion Model Plus Algorithms for Unstable Situations (CTDMPLUS)[1, 2]	USEPA	A refined point source gaussian air quality model for use in all stability conditions for complex terrain. The purpose of the model is to provide a practical, refined plum model for elevated point sources near complex terrain.	Project-level	SO_2, ROG, NO_2, Lead, $PM_{2.5}$, PM_{10}	This model operates at the project-level and provides air dispersion modeling for a project's emissions on the surrounding environment. However, even with supplementary (i.e. additional software), the model cannot estimate specific health effects on receptors from the air dispersion modeling. Moreover, it cannot model the (complex) chemical reactions that occur between the ozone precursors (e.g. NOx and ROG) that generate ozone. Therefore, this model is not recommended for correlating project-generated criteria pollutant emissions to health end points

[4] See: https://public.tepper.cmu.edu/nmuller/APModel.aspx

TOOL	*CREATED BY*	*DESCRIPTION*	*RESOLUTION*	*POLLUTANTS ANALYZED*	*PROJECT-LEVEL CEQA APPLICABILITY*
Comprehensive Air Quality Model with Extensions (CAMx)[5]	Ramboll	CAMx is a multi-scale, three dimensional photochemical grid model. A photochemical grid model is a computer model designed for simulating air pollution episodes. CAMx is designed for computing hourly ozone concentrations at the regional, mesoscale, and urban scales for periods ranging from days up to months.	Regional, county, or city-levels	Ozone, CO, and secondary PM	CAMx is intended to accurately depict the ways in which air pollution forms, accumulates, and dissipates. However, it cannot provide results at a project-level.
Co-Benefits Risk Assessment (COBRA)[6]	USEPA	Preliminary screening tool that contains baseline emission estimates of a variety of air pollutants for a single year. COBRA is targeted to state and local governments as a screening assessment for clean energy policies. EPA's CO–Benefits Risk Assessment (COBRA) screening model is a free tool that helps state and local governments: • Explore how changes in air pollution from clean energy policies and programs; • Estimate the economic value of the health benefits associated with clean energy policies and programs to compare against program costs; • Map and visually represent the air quality, human health, and health-related economic benefits from reductions in emissions of particulate matter ($PM_{2.5}$), sulfur dioxide ($S0_2$), nitrogen oxides (NO_X), ammonia (NH_3), and volatile organic compounds (VOCs) that result from clean energy policies and programs.	National, regional, state, or county-levels	$PM_{2.5}$, SO_2, NO_x, NH_3, and ROG	COBRA is a preliminary screening tool only and cannot be used at sub-county resolution. It cannot provide results at a project-level. It also does not account for secondary emission changes resulting from market responses. Accordingly, the tool is not recommended for project-level CEQA analysis.
Environmental Benefits and Mapping Program-Community Edition (BenMAP-CE)[7]	USEPA	The USEPA's detailed model for estimating the health impacts from air pollution. It relies on input concentrations and applies concentration-response (C-R) health impact functions, which relate a change in the concentration of a pollutant with a change in the incidence of a health endpoint, including premature mortality, heart attacks, chronic respiratory illnesses, asthma exacerbation and other adverse health effects. Detailed inputs are required for air quality changes (concentrations from AERMOD), population, baseline incidence rates, and effect estimates.	National, County, City, and population levels	Ozone, PM, NO_2, SO_2, CO	This model provides an estimate of and characterizes the general impacts to health functions that relate change in health outcomes (coughs, asthma incidences, premature mortality) that change with small changes in ambient air concentrations. However, this model cannot provide results at a project-level. Accordingly, the tool is not recommended for project-level CEQA analysis.

Tool	*Created by*	*Description*	*Resolution*	*Pollutants Analyzed*	*Project-level CEQA Applicability*
Fast Scenario Screening Tool (TM5-FASST)[8]	Joint Research Centre (Italy)	A tool that allows users to evaluate how air pollutant emissions affect large scale pollutant concentrations and their impact on human health (mortality and years of life lost) and crop yield from national to regional air quality policies, such as climate policies. The target policy domains are national to regional air quality policies, or air pollutant scenarios linked to other policy domains (e.g. climate policy). The tool is web-based and does not require coding or modelling. Users must gain access through publishers.	Global and national-levels	$PM_{2.5}$, Ozone, NO_x, NH_3, CO, ROG, CH_4, SO_2	This tool is applicable at national to global scales. It cannot provide results a project-level. Accordingly, the tool is not recommended for project-level CEQA analysis.
Hotspots Analysis and Reporting Program (HARP)	California Air Resources Board (CARB)	The Hotspots Analysis and Reporting Program (HARP) is a software suite that addresses the programmatic requirements of the Air Toxics "Hot Spots" Program (Assembly Bill 2588). HARP incorporates the information presented in the 2015 Air Toxics Hotspots Program Guidance Manual for Preparation of Health Risk Assessments. HARP can be used by the air pollution control and air quality management districts (districts), facility operators and other organizations or individuals to promote statewide consistency, efficiency and cost-effective development of facility emission inventories and conducting health risk assessments.	Statewide, Air District, and Project-levels	$PM_{2.5}$, PM_{10}, air toxics, TACs, Ozone, NO_2, CO, SO_2	This model operates at the project-level and provides the ability to combine air dispersion modeling data (e.g. from AERMOD) to conduct health risks assessments and assessment of pollutant concentrations at receptors surrounding a project. This model is often used in conjunction with AERMOD (to incorporate air dispersion modeling data provided by AERMOD). However, the model does not estimate specific health effects on receptors from the air dispersion modeling (that is, it is not scientifically feasible to infer individualized health effects on receptors from the pollutant concentrations identified by this model, even in conjunction with other software such as AERMOD). Moreover, scientifically valid modeling of ozone concentrations is not possible with HARP (nor any other known model used in conjunction with HARP), due to the complex nature of pollution concentration formation and numerous regional influences (multiple emission sources, meteorology, atmospheric chemistry and geography). Therefore, this model is not recommended for estimating the health effects of project-generated criteria pollutants.
Human Exposure Model (HEM)	USEPA	The HEM is used primarily for performing risk assessments for sources emitting air toxics to ambient air. The HEM only addresses the inhalation pathway of exposure, and is designed to predict risks associated with chemicals emitted into the ambient air (i.e., in the vicinity of an emitting facility but beyond the facility's property	Project-level	SO_2, ROG, NO_2, Lead, $PM_{2.5}$, PM_{10}, NH_3	This model does not estimate specific health effects on receptors (that is, it is not scientifically feasible to infer individualized health effects on receptors from the pollutant concentrations identified by this model. Moreover, scientifically valid modeling of ozone concentrations is not possible with HEM, due to the

[8] See: http://tm5-fasst.jrc.ec.europa.eu/

Tool	*Created by*	*Description*	*Resolution*	*Pollutants Analyzed*	*Project-level CEQA Applicability*
		boundary). The HEM provides ambient air concentrations, as surrogates for lifetime exposure, for use with unit risk estimates and inhalation reference concentrations to produce estimates of cancer risk and noncancer hazard, respectively, for the air toxics modeled.			complex nature of pollution concentration formation and numerous regional influences (multiple emission sources, meteorology, atmospheric chemistry and geography). Therefore, this model is not recommended for estimating the health effects of project-generated criteria pollutants.
Long-range Energy Alternatives Planning System-Integrated Benefits Calculator (LEAP-IBC)[9]	Climate and Clean Air Coalition (CCAC)	A calculator that allows users to rapidly estimate the impacts of reducing emissions on health, climate, and agriculture. The tool uses sensitivity coefficients that link gridded emissions of air pollutants and precursors to health, climate and agricultural impacts at a national level. The tool is primarily used for policy analysis. The tool is currently Excel-based and is available through the developers only. A web-based interface is currently under development.	National-level	$PM_{2.5}$, Ozone, NO_2	This tool is applicable at national scale. Accordingly, the tool is not recommended for project-level CEQA analysis.
Methodology for Estimating Premature Deaths Associated with Long-Term Exposure to Fine Airborne Particulate Matter in California[10]	CARB	The staff report identifies a relative risk of premature death associated with $PM_{2.5}$ exposure based on a review of all relevant scientific literature, and a new relative risk factor was developed. This new factor is a 10% increase in risk of premature death per 10 $\mu g/m^3$ increase in exposure to $PM_{2.5}$ concentrations (uncertainty interval: 3% to 20%)	National	$PM_{2.5}$	The primary author of the CARB staff report notes that the analysis method is not suited for small projects and may yield unreliable results due to various uncertainties. The tool also cannot provide results on a project-level. Accordingly, the tool is not recommended for project-level CEQA analysis.
Multi-Pollutant Evaluation Method (MPEM)[11]	Bay Area Air Quality Management District (BAAQMD)	Estimates the impacts of control measures on pollutant concentration, population exposures, and health outcomes for criteria, toxic, and GHG pollutants. Monetizes the value of total health benefits from reductions in $PM_{2.5}$, ozone, and certain carcinogens, and the social value of GHG reductions. MPEM was designed for development of a Clean Air Plan for the San Francisco Bay Area. The inputs are specific to the SF region and are not appropriate for projects outside BAAQMD.	Regional level in the SFBAAB	Ozone, PM, air toxics, GHG	This tool is designed to support the BAAQMD in regional planning and emissions analysis within the San Francisco Bay Area Air Basin (SFBAAB). The model applies changes in pollutant concentrations over a four-square kilometer grid. The tool also cannot provide results on a project-level. Additionally, this tool is only applicable for the SFBAAB. Accordingly, the tool is not recommended for project-level CEQA analysis. This project is also not

Tool	*Created by*	*Description*	*Resolution*	*Pollutants Analyzed*	*Project-level CEQA Applicability*
					recommended for projects outside of the SFBAAB.
Offshore and Coastal Dispersion Model Version 5 (OCD)[1, 2]	USEPA	A straight-line Gaussian model developed to determine the impact of offshore emissions from point, area or line sources on the air quality of coastal regions. OCD incorporates overwater plume transport and dispersion as well as changes that occur as the plume crosses the shoreline. Hourly meteorological data are needed from both offshore and onshore locations.	Project-level	SO_2, ROG, NO_2, Lead, $PM_{2.5}$, PM_{10}	This model operates at the project-level and provides air dispersion modeling for a project's emissions on the surrounding environment. However, even with supplementary (i.e. additional software), the model cannot estimate specific health effects on receptors from the air dispersion modeling. Moreover, it cannot model the (complex) chemical reactions that occur between the ozone precursors (e.g. NOx and ROG) that generate ozone. This tool is used to address offshore emissions on coastal regions and is not appropriate for project-level CEQA analysis for inland locations.
Response Surface Model (RSM)-based Benefit-per-Ton Estimates[12]	USEPA	Consists of tables reporting the monetized $PM_{2.5}$-related health benefits from reducing $PM_{2.5}$ precursors from certain source types nationally and for 9 US cities/regions. Applying these estimates simply involves multiplying the emissions reduction by the relevant benefit per-ton metric. The resulting value is the PM mortality risk estimate at a 3% discount rate.	National or regional (San Joaquin County only) levels	SOx, VOC, NH_3, NO_x	RSM includes regional values specific to San Joaquin County and does not address development project-scale emissions. The values are also outdated. Accordingly, the tool is not recommended for project-level CEQA analysis.
Sector-based Benefit-per-Ton Estimates[13]	USEPA	Two specific sets of Benefit-per-ton (BPT) estimates for 17 key source categories are available. Both are a reduced-form approach based on BenMAP modeling. Applying these factors involves multiplying the emissions reduction (in tons) by the relevant benefit (economic value) or incidence (rates of mortality and morbidity) per-ton metric. The resulting value is the economics, mortality, and morbidity of direct and indirect $PM_{2.5}$ emissions.	National-scale	$PM_{2.5}$, SO_2, NO_x	The BPT estimates do not account for project-specific emissions or receptor locations, local dispersion characteristics, or regional photochemistry. The resultant health effects are therefore reflective of national averages and would not reflect localized conditions necessary to address impacts at the project-level. Accordingly, the tool is not recommended for project-level CEQA analysis.

Executive Summary

This report presents the results of a delineation of the aquatic resources at the 530-acre The Ranch, located in the City of Rancho Cordova, California. Aquatic resources were identified and delineated following the technical guidelines provided in the *Corps of Engineers Wetlands Delineation Manual* (Corps Manual) (Environmental Laboratory 1987) and the U.S. Army Corps of Engineers (Corps) *Arid West Regional Supplement* (Supplement) (USACE 2008). The Supplement presents wetland indicators, delineation guidance, and other information that is specific to the Arid West Region. The jurisdictional boundaries for other waters of the U.S. were identified based on the presence of an ordinary high water mark (OHWM) as defined in 33 C.F.R. 328.3(e).

A total of 21.53 acres of waters of the United States, comprising 2.92 acres of depressional seasonal wetlands, 15.04 acres of vernal pools, 1.66 acres of riverine seasonal wetlands, 0.06 acres of seasonal wet swale, 1.54 acres of intermittent drainage, and 0.30 acres of detention basin outfall were delineated at the project site. The detention basin outfall is authorized by the U.S. Army Corps of Engineers Regulatory Permit #200100252.

DRAFT

1.0 INTRODUCTION

The purpose of this document is to present the results of a formal delineation of jurisdictional waters of the United States (U.S.), including wetlands, on the ±530-acre The Ranch (site) located in the City of Ranch Cordova, California (**Figure 1**). This report was prepared in accordance with the *Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (USACE 2016) and presents the results of Foothill Associates' review of available literature, aerial photographs, soil surveys (**Figure 2**), and fieldwork within the Site. The delineation methodology is described in this report, followed by the results of the delineation. Contact information and directions to the Site are provided in **Appendix A**. Site access notification information is provided in **Appendix B**. Details regarding soils, topography, hydrology, and vegetation are summarized herein and routine wetland determination data forms are provided in **Appendix C**. A detailed delineation map that illustrates potential waters of the U.S. within the Site is included in **Figure 3**.

All aquatic features that may have been impacted by The Ranch were mapped and addressed in a 2014 Preliminary Jurisdictional Determination (Regulatory No. SPK-2004-00707) issued by the U.S. Army Corps of Engineers; but modifications to the proposed design layout requires a new jurisdictional delineation.

DRAFT

2.0 REGULATORY BACKGROUND

The Corps regulates discharge of dredged or fill material into waters of the United States under Section 404 of the Clean Water Act (CWA). "Discharges of fill material" is defined as the addition of fill material into waters of the U.S., including, but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes; and subaqueous utility lines [33 C.F.R. §328.2(f)].

Section 401 of the CWA (33 U.S.C. 1341) requires any applicant for a Federal license or permit to conduct any activity that may result in a discharge of a pollutant into waters of the United States to obtain a certification that the discharge will comply with the applicable effluent limitations and water quality standards.

Section 404 of the CWA requires approval prior to discharging dredged or fill material into the waters of the United States. Typical activities requiring Section 404 permits are:

- Depositing of fill or dredged material in waters of the U.S. or adjacent wetlands;
- Site development fill for residential, commercial, or recreational developments;
- Construction of revetments, groins, breakwaters, levees, dams, dikes, and weirs; and
- Placement of riprap and road fills.

Section 10 of the Rivers and Harbors Act of 1899 requires approval prior to the accomplishment of any work in or over navigable waters of the United States, or which affects the course, location, condition, or capacity of such waters. Typical activities requiring Section 10 permits are:

- Construction of piers, wharves, bulkheads, dolphins, marinas, ramps, floats intake structures, and cable or pipeline crossings; and
- Dredging and excavation.

Any person, firm, or agency (including Federal, state, and local government agencies) planning to work in navigable waters of the United States, or dump or place dredged or fill material in waters of the United States, must first obtain a permit from the Corps. Permits, licenses, variances, or similar authorization may also be required by other Federal, state, and local statutes.

2.1. Waters of the United States

Waters of the United States were defined in a Federal Rule published on June 29, 2015 and which went into effect on August 28, 2015. The term "waters of the United States" includes (a) traditional navigable waters, (b) interstate waters, (c) territorial seas, (d) impoundments of jurisdictional waters, and (e) their tributaries. Tributaries must have a bed and bank and

DRAFT

ordinary high water mark and may have ephemeral, intermittent, or perennial flow. Additionally, the rule defines "adjacent waters" as jurisdictional due to their significant nexus with a jurisdictional water in class (a) through (e). Adjacent waters include any waters located in whole or part within 100 feet of a jurisdictional water in class (a) through (e); any waters located within the 100-year floodplain and within 1,500 feet of a jurisdictional water in class (a) through (e); and any waters within 1,500 feet (f) the ordinary high water mark of a traditionally navigable water, territorial sea, or the Great Lakes. Five classes of waters, prairie potholes, Carolina bays and Delmarva bays, pocosins, western vernal pools, and Texas coastal prairie wetlands, were determined to be jurisdictional due to their nexus with jurisdictional waters when considered in combination with similarly situated waters. Other waters not previously defined as jurisdictional that are located within the 100-year floodplain of a traditionally navigable water, interstate water, or territorial sea or are within 4,000 feet of the ordinary high water mark of a jurisdictional water in class (a) through (e) are evaluated on a case-specific basis.

The rule specifically exempts the following types of features from Federal jurisdiction: waste treatment systems, including ponds or lagoons designed to meet the requirements of the Clean Water Act, prior converted cropland, ditches with ephemeral or intermittent flow that are not a relocated tributary, excavated in a tributary, or drain wetlands, ditches that do not flow directly or indirectly into a jurisdictional water, artificially irrigated areas that would revert to dry land should irrigation cease, artificial constructed lakes, ponds, reflecting pools, or swimming pools constructed in uplands, water filled depressions created in uplands incidental to mining or construction activity, erosional features, puddles, and stormwater control features and wastewater recycling structures constructed in uplands [33 C.F.R. § 328.3].

The new rule was challenged in court and on October 9, 2015 the U.S. Court of Appeals for the Sixth Circuit stayed the new rule nationwide. Until a final ruling is made, the Corps will continue to operate pursuant to the Supreme Court's decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (126 S. Ct. 2208) and agency guidance subsequent to this decision. Under these rules, the Corps will assert jurisdiction over wetlands adjacent to traditional navigable waters, relatively permanent non-navigable tributaries (i.e., waters that have a continuous flow at least three months out of the year), and wetlands that abut relatively permanent tributaries. The Corps will determine jurisdiction over waters that are non-navigable tributaries that are not relatively permanent, and wetlands adjacent to these tributaries, by making a determination whether such waters "significantly affect the chemical, physical, and biological integrity of other jurisdictional waters more readily understood as "navigable." Finally, the Corps generally does not consider the following to be "waters of the United States": swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent or short duration flow) and ditches "wholly in and draining only uplands…which do not carry a relatively permanent flow of water." Navigable waters of the United States are defined as waters that have been used in the past, are now used, or are susceptible to use as a means to transport interstate or foreign commerce up to the head of navigation.

DRAFT

Section 10 and/or Section 404 permits are required for construction activities in these waters. Boundaries between jurisdictional waters and uplands are determined in a variety of ways depending on which type of water is present. Methods for delineating wetlands and non-tidal waters are described below.

Wetlands are defined as "*those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions*" [33 C.F.R. §328.3(b)]. Presently, to be a wetland, a site must exhibit positive indicators of three wetland criteria: hydrophytic vegetation, hydric soils, and wetland hydrology existing under the "normal circumstances" for the site.

The lateral regulatory extent of non-tidal waters is determined by delineating the ordinary high water mark (OHWM) [33 C.F.R. §328.4(c)(1)]. The OHWM is defined by the Corps as "*that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas*" [33 C.F.R. §328.3(e)].

DRAFT

3.0 METHODS

3.1. Site-Specific References

Available information pertaining to the natural resources of the region was reviewed. All references reviewed for this delineation are listed in **Section 6.0**. Pertinent site-specific reports and general references utilized for the delineation include the following:

3.2. Research and Field Methodology

This delineation utilized the Corps' 1987 three-parameter (vegetation, hydrology, and soils) methodology to delineate aquatic resources. The Supplement was also used in conjunction with the Corps Manual for applications in the Arid West Region. Where differences in the two documents occur, the Supplement takes precedence over the Corps Manual.

The Arid West Region consists of all or significant portions of 11 states, including California (USACE 2008). This region is differentiated from other surrounding areas by having a predominantly dry climate and long summer dry season. Vegetation characteristics of the Arid West Region include little to no forest cover consisting of mainly annual grasslands, shrublands, hardwood savannas, deciduous woodlands, and pinyon/juniper woodlands. The Arid West

DRAFT

Supplement was used on this site because it is located in the *Mediterranean California* Land Resource Region (LRR C), which is characterized by warm, wet winters and dry summers.

The three-parameter methodology requires the collection of data on soils, vegetation, and hydrology at several locations to establish the jurisdictional boundary of wetlands. Additional methods to identify and delineate other waters of the U.S. (e.g., streams, drainages, lakes) were used as applicable. The method typically used for delineation of non-wetland waters of the U.S. is the delineation of the OHWM. The OHWM was identified based on soils, vegetation, slope, and other indicators such as debris and high water marks.

A review of historic and recent aerial photographs, topographic maps, and soils survey data was conducted before delineating the Site in December 2003, and January through April 2004. Revisions were made in the field with Justin Cutler and/or Will Ness of the U.S. Army Corps of Engineers in April and June in 2005 and a reverification was conducted in October 2014. Biologists visually inspected the entire site and collected representative data at points within potential wetland areas and corresponding uplands. The location of each data point is depicted in **Figure 3** and corresponding routine wetland determination data forms are provided in **Appendix C**.

Correlations were developed between the three parameters (vegetation, hydrology, and soils) to make wetland determinations. Specifically, plots at data point locations were evaluated to determine the composition and identification of dominant plant species. The indicator status of all dominant plant species [as determined by the current *National Wetland Plant List*] was applied and evaluated as part of the vegetation assessment portion of the wetland determination process. The plant indicator status includes the following categories:

Obligate wetland plants (OBL):	Occur almost always under natural wetland conditions (estimated probability > 99%).
Facultative wetland plants (FACW):	Usually occur in wetlands, but occasionally found in non-wetlands (67-99%).
Facultative plants (FAC):	Equally likely to occur in wetlands and non-wetlands (34-66%).
Facultative upland plants (FACU):	Usually occur in non-wetlands, but occasionally found in wetlands (1-33%).
Upland (UPL):	Occur almost always under natural conditions in non-wetlands (>99%); may occur in wetlands in other regions.

The absolute cover was estimated for each vegetation stratum; these strata include tree, sapling/shrub, herb, and woody vine. Species that are dominant in more than one stratum were counted multiple times. Some wetland plant communities may fail a test based only on dominant species. Where indicators of hydric soils and hydrology are present and vegetation is

DRAFT

not dominated by hydrophytes, the vegetation was re-evaluated with the prevalence index, which takes into consideration all plant species in the community, not just the subset of dominant species.

The onsite soils were examined for hydric indicators. Hydric soil indicators are described in the *Field Indicators of Hydric Soils in the U.S.*, Version 7.0 (USDA, NRCS, 2010 and 2015). If one or more of these indicators are present, then the soil is hydric. Nearly all hydric soils exhibit characteristic morphologies that are caused by anaerobic, reduced soil conditions due to prolonged soil saturation. The most commonly observed indicators are related to iron (Fe) and manganese (Mn) redox concentrations or depletions. Less commonly observed indicators include gleyed matrix and black histic (low amounts of Fe-Mn and accumulations of organic carbon).

Observations were made and recorded for both primary and secondary wetland hydrology indicators, if present. Without monitoring or direct observation of inundation/saturation, indirect indicators of wetland hydrology are typically used and include primary indicators such as water marks, drift lines, and sediment deposits, or secondary indicators such as crayfish burrows or the FAC-neutral test.

3.3. GPS Data Integration

Boundaries of wetlands and other waters of the U.S. within the Site were surveyed and mapped with a Trimble GeoXT Global Positioning System (GPS) hand-held unit. This is a mapping-grade GPS unit capable of real-time differential correction and sub-meter accuracy. The GPS data were downloaded from the unit and differentially corrected utilizing Trimble Pathfinder Office software and appropriate base station data, and then converted to ESRI ® shape file format. Data are typically exported to the Geographic Information System (GIS) software in the State Plane coordinate system (NAD 83) with units as "survey feet." Within the GIS, data are edited and linear features are built into polygons using recorded width information. All wetland shape files are merged to create a single wetland file with calculated acreages. These results are presented in **Figure 3**.

DRAFT

4.0 RESULTS

4.1. Site Location and Land Use

4.1.1. Site Location

The ±530-acre Site is located in southeastern Sacramento County, approximately five miles south of U.S. Highway 50, east of Sunrise Boulevard, and the Folsom South Canal, and north of Jackson Road (Highway 16) within the City of Ranch Cordova. The Site lies east of and adjacent to Rancho Cordova Parkway, south of Douglas Road, and west of and adjacent to the proposed Americanos Boulevard. The Site is located in Township 8 North, Range 7 East, Section 16, in an area covered by the USGS *Buffalo Creek* 7.5-minute quadrangle (**Figure 1**).

4.1.2. Land Use

The majority of the Site is annual grassland, previously used to livestock grazing. Land uses surrounding the Site include residential development and agricultural (livestock grazing).

4.2. Physical Features

4.2.1. Soils

The Natural Resources Conservation Service has mapped five soil units on the Site (**Figure 2**). These include: **Fiddyment Fine Sandy Loam, 1 to 8 Percent Slopes**, **Hicksville Gravelly Loam, 0 to 2 Percent Slopes, Occasionally Flooded**, **Red Bluff-Redding Complex, 0 to 5 Percent Slopes**, **Redding Gravelly Loam, 0 to 8 Percent Slopes**, and **Redding Loam, 2 to 8 Percent Slopes**. General characteristics associated with these soils types are described below.

- **Fiddyment Fine Sandy Loam, 1 to 8 Percent Slopes**: This moderately deep, well-drained soil is located on hills between 50 and 350 feet above mean sea level (MSL). This soil formed in material weathered from consolidated sandstone or siltstone. Permeability is very slow and available water capacity is low. As a result, this soil type takes a very long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil unit is typically used for rangeland, irrigated hay and pasture, or for dryland crops, such as wheat. Typically, vegetation on this soil unit consists mainly of non-native grasses and herbaceous plant species. The hydric soils list for Sacramento County does not identify any hydric inclusions occurring within this soil type.
- **Hicksville Gravelly Loam, 0 to 2 Percent Slopes, Occasionally Flooded**: This very deep, moderately well-drained soil is on low stream terraces and the alluvial flats adjacent to drainageways on high terraces and hills between 75 to 230 feet above MSL. This soil unit formed in alluvium derived from mixed rock sources. Permeability is moderately slow in this soil type and available water capacity is low. As a result, this soil type takes a moderately long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil type is typically used as rangeland or for irrigated crops. Typically, vegetation on this soil unit consists mainly of non-native

DRAFT

grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies two hydric inclusions occurring within this soil type, Columbia and Hicksville.

- **Red Bluff-Redding Complex, 0 to 5 Percent Slopes**: This soil complex is located on high terraces, between 90 to 310 feet above MSL. The Red Bluff soil is very deep and well drained. This soil formed in alluvium derived from mixed rock sources. This soil complex consists of approximately 45 percent Red Bluff soil and 40 percent Redding soil. Permeability is moderately slow and available water capacity is high in the Red Bluff soil. As a result, this soil type takes a moderately long time to saturate and the capacity of the soil to hold water available for use by most plant species is high. The Redding soil is moderately deep and moderately well drained. Permeability is very slow in the Redding soil and available water capacity is low. As a result, this soil type takes a long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil complex is used mainly as rangeland or to cultivate dry land crops, such as wheat. Typically, vegetation on this soil complex consists of non-native annual grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type.
- **Redding Gravelly Loam, 0 to 8 Percent Slopes**: This moderately deep, well-drained soil type is located on high terraces and terrace remnants between 40 to 390 above MSL. This soil formed in gravelly and cobbled alluvium derived from mixed rock sources. Permeability is slow in Redding gravelly loam and available water capacity is low. As a result, this soil type takes a long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil unit is mainly used as rangeland for livestock grazing. In some areas this unit is used for irrigated hay and pasture or for dryland crops, such as wheat. Typically, vegetation on this soil unit consists of non-native annual grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type.
- **Redding Loam, 2 to 8 Percent Slopes**: This moderately deep, moderately well-drained soil is on high terraces and terrace remnants between 40 to 170 feet above MSL. This soil formed in gravelly and cobbly alluvium derived from mixed rock sources. Permeability is very slow in the Redding soil and available water capacity is low. As a result, this soil type takes a long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil type is typically used for rangeland and less frequently for dryland crops, such as wheat, or irrigated crops, such as hay. Typically, vegetation on this soil unit consists of non-native annual grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type.

4.2.2. Topography

The Site exhibits low relief topography with elevations ranging between 170 and 220 feet above MSL. The slopes throughout the Site range from approximately 0 to 8 percent. Moderate rolling

DRAFT

hills and extensive flatlands interspersed with seasonal drainage courses and wetlands typify the topography of the Site.

4.2.3. Regional Hydrology

The Site is located in the Upper Morrison Creek and Laguna Creek Watersheds (Hydrologic Unit Codes: 180201630402 and 180201630403). The Upper Morrison Creek Watershed encompasses approximately 50 square miles. The Laguna Creek Watershed encompasses approximately 45 square miles.

4.2.4. Site-Specific Hydrology

The Site is crossed by an unnamed intermittent drainage that runs northeast to southwest and flows offsite under Rancho Cordova Parkway. Water leaves the Site through the intermittent drainage as well as over land and through small riverine wetlands towards the east and south. Water enters the Site through the intermittent drainage, as well as through seasonal precipitation.

4.3. Vegetation

The vegetation assemblages and habitat types occurring on the Site include the following: California annual grassland and disturbed/development habitat.

4.3.1. California Annual Grassland

California annual grassland consists of a myriad of native and non-native annual plant species and occurs in a majority of the state at elevations from sea level to approximately 4,000 feet above MSL. Composition of this vegetation community varies depending on distribution, geographic location and land use. Additional major influences on this vegetation community include soil type, annual precipitation, and fall temperatures.

The plant community covering the majority of the Site is annual grassland, which accounts for 506.07 acres of the Site and is characterized primarily by an assemblage of non-native grasses and forbs. Much of the vegetation in these communities is common to the Central Valley. Dominant grass species consists of Italian rye grass (*Festuca perennis*), rattail sixweeks grass (*Festuca myuros*), soft brome (*Bromus hordeaceus*), and slender wild oat (*Avena fatua*). Common dominant herbaceous non-natives include jointed charlock (*Raphanus raphanistrum*) and field bindweed (*Convolvulus arvensis*).

4.3.2. Disturbed/Developed

Disturbed/developed habitat accounts for 2.45 acres in the Site. This habitat occurs in strictly defined areas consisting of portions of Rancho Cordova Parkway and a dirt roadway entering the Site from Big Meadow Way.

4.4. Classification of Aquatic Resources

As discussed previously in **Section 2.0**, aquatic resources are classified into multiple types based on topography, edaphics (soils), vegetation, and hydrologic regime. Primarily, the Corps

DRAFT

establishes two distinctions: wetland and non-wetland waters, which are commonly referred to as other waters.

Wetland types mapped within the Site include the following: depressional seasonal wetland, vernal pool, riverine seasonal wetland. Other waters delineated within the Site include: intermittent drainage, seasonal wet swale, and detention basin outfall. A description of all of the features delineated within the Site is provided in the following sections. Wetland data sheets are included in **Appendix C**.

4.4.1. Depressional Seasonal Wetland

A total of approximately **2.92 acres** of depressional seasonal wetlands have been identified within the Site. Depressional seasonal wetlands exhibit a hydrologic regime dominated by saturation, rather than inundation. Depressional seasonal wetlands were identified in the Site as depressions within the topography with a hydrologic regime dominated by saturation and capable of supporting hydrophytic plant species and hydric soils. Plant species in depressional seasonal wetlands are adapted to withstand short periods of saturation or saturated soils conditions but will not withstand prolonged periods of inundation, as is common in vernal pools. Vegetation observed in seasonal wetlands included: coyote thistle (*Eryngium vaseyi*), rabbitsfoot grass (*Polypogon monspeliensis*), hyssop loosestrife (*Lythrum hyssopifolia*), annual hairgrass (*Deschampsia danthonioides*), and Fremont's goldfields (*Lasthenia fremontii*).

4.4.2. Vernal Pool

A total of **15.04 acres** of vernal pools have been identified within the Site. Vernal pools are shallow, seasonally inundated depressional wetlands that form in soils with a subsurface layer that restricts the downward flow of water. These layers include hardpans, claypans, or thick clay layers. Vernal pools were identified in the Site as depressions within the topography with a hydrologic regime dominated by inundation and capable of supporting hydrophytic plant species and hydric soils. Plant species found within vernal pools are those that require extended periods of inundation and, as such, are commonly associated with these seasonal wetland features. Vegetation observed in the vernal pools onsite included: coyote thistle, Mediterranean barley, and stalked popcornflower (*Plagiobothrys stipitatus*).

4.4.3. Riverine Seasonal Wetland

A total of **1.66** acres of riverine seasonal wetlands have been identified within the Site. Riverine seasonal wetlands are defined by a hydrologic regime dominated by unidirectional flow of water. Riverine seasonal wetlands typically occur in topographic folds or swales and represent natural drainages that convey sufficient water to support wetland vegetation. Riverine seasonal wetlands typically convey water during and shortly after storm events. Riverine seasonal wetlands may have a moderately defined bed and bank and often exhibit sufficient gradient to convey water. As in depressional seasonal wetlands, plant species found within riverine seasonal wetlands are typically adapted to a hydrologic regime dominated by saturation rather than inundation. Dominant vegetation within the riverine seasonal wetlands includes: coyote thistle, rabbitsfoot grass, hyssop loosestrife, annual hairgrass, and Fremont's goldfields.

DRAFT

4.4.4. Seasonal Wet Swale

The seasonal wet swale accounts for **0.06 acres** of the Site and is located at the center of the southern boundary of the Site. Seasonal wet swales are not considered jurisdictional waterbodies, but do convey and hold water during and after storm events and can exhibit assemblages of wetland vegetation. Dominant vegetation of seasonal wet swales typically consists of grass and other wetland vegetation.

4.4.5. Intermittent Drainage

Intermittent drainages account for **1.54 acres** of the Site. Intermittent drainages are features that may not meet the three-parameter criteria for vegetation, hydrology, and soils, but do convey water and exhibit an OHWM. Water flows within intermittent drainages are fed primarily by precipitation and stormwater runoff. Dominant vegetation within consists of coyote thistle.

4.4.6. Detention Basin Outfall

The detention basin outfall accounts for **0.30 acres** of the Site and is located near the eastern end of the northern border. This detention basin outfall is actively maintained with reinforced large gravel barriers at either end. In addition, there does not appear to be any vegetation within or on the banks of the basin. The detention basin outfall is authorized by Regulatory Permit # 200100252.

DRAFT

5.0 CONCLUSIONS

All aquatic features that may have been impacted by The Ranch were mapped and addressed in a 2014 Preliminary Jurisdictional Determination (SPK-2004-00707), but modifications to the proposed design layout requires a new jurisdictional delineation.

The wetland types mapped within the Site include: depressional seasonal wetlands, vernal pools, and riverine seasonal wetlands. Non-wetland waters that were delineated within the Site include: seasonal wet swale, intermittent drainage, and detention basin outfall. The detention basin outfall is authorized by Regulatory Permit # 200100252. Areas deemed jurisdictional will be subject to the regulatory requirements of the federal Clean Water Act including permitting and mitigation, as required.

Table 1, below, summarizes the acreage per class of aquatic feature found on the Site. Detailed information on each feature is included in **Appendix C**.

TABLE 1 — AQUATIC RESOURCES WITHIN THE SITE

Aquatic Resource Type	Aquatic Resources Classification	Aquatic Resource Size (acres)
Depressional Seasonal Wetland	PEM2B	2.92
Vernal Pool	PEM2C	15.04
Riverine Seasonal Wetland	PEM2B	1.66
Seasonal Wet Swale	R4SB7	0.06
Intermittent Drainage	R4SB	1.54
Detention Basin Outfall	R4SB5	0.30
Total	**--**	**21.53***

*Acreages are calculated to six significant figures and subsequently round to three significant figures. Total acreage is further rounded to two significant figures.

Digital GIS data file provides area in square feet as well as acres.
**Based on sum of subtotals at 2 significant figures.

WATERS OF THE U.S.

CLASSIFICATION	ACREAGE
DEPRESSIONAL WETLANDS	
Seasonal Wetland (DSW)	2.921
Vernal Pool (VP)	15.042
RIVERINE WETLANDS	
Seasonal Wetland (RSW)	1.664
Seasonal Wet Swale (SWS)	0.059
OTHER WATERS OF THE U.S.	
Intermittent Drainage (ID)	1.544
Drainage Basin Outfall	0.303
TOTAL	21.53

Other Features

- Data Point
- Project Boundary ±530 Acres

NOTES

- Delineated waters of the U.S, verified 8/15/05; #200400700.
- Digital base data provided by Wood Rodgers, Inc. Contour interval is 1 foot.
- Hydrologic Unit Code (HUC) for this site is 18020109.
- This wetland delineation utilizes the Corps' 1987 three-parameter methodology to delineate jurisdictional waters of the U.S.
- Study area wetlands and other waters of the U.S. were mapped using a Trimble GPS (Global Positioning System).

Appendix A — Contact Information and Directions

Client/Agent Contact Information:	Olga Sciorelli K. Hovnanian Homes 3721 Douglas Boulevard, Suite 150 Roseville, CA 95661 Phone Number: (916) 945-5362 Email: osciorelli@khov.com
Delineation Conducted By:	David Bise (Point of Contact) Rosie Black Cristian Singer Foothill Associates 590 Menlo Drive, Suite 5 Rocklin, CA 95765 Phone Number: (916) 435-1202 Email: dbise@foothill.com
Directions to the Project Site:	From Highway 50 east, take the Zinfandel Drive exit, turn right to stay on Zinfandel Drive, left onto Douglas Road, right onto Sunrise Boulevard, left onto Chrysanthy Boulevard, right on Steccato Drive, left on Appolon Drive, right on Sophistry Drive, left on Pericles Drive, and then left on Rancho Cordova Parkway. Rancho Cordova Parkway is the west boundary of the Project Site. The Project Site can be located within Section 16 of Township 8 North, Range 7 East on the USGS *Buffalo Creek*, California 7.5-minute quadrangle (38°32'45.6"N, 121°12'54.5"W).

DRAFT

Appendix B — Signed Statement Form Property Owner(s) Allowing Access

DRAFT

In the event the U.S. Army Corps of Engineers determined that a site inspection is necessary, I request the USACE to first contact Foothill Associates (Attn: David Bise) at (916) 435-1202 to schedule a date and time to enter the property described in this report. If the property is land-locked, the owner or proponent must obtain permission from the adjacent property owner(s) in order to provide access. I understand that this may delay the USACE's jurisdictional determination and the USACE's issuance of a determination letter.

Appendix C — Routine Wetland Determination Data Forms

Data forms provided herein are from the original 2005 delineation. While modifications and additions to jurisdictional features occurred between the original delineation and the 2014 Preliminary Jurisdictional Determination (Regulatory No. SPK-2004-00707), formal data forms were not required and are therefore not included.

DATA FORM
ROUTINE WETLAND DETERMINATION
(1987 COE Wetlands Delineation Manual)

Project/Site: Jaeger 530 Applicant/Owner: River West Investments, Inc. Investigator: Cristian Singer	Date: 03/24/2004 County: Sacramento State: California
Do Normal Circumstances exist on the site? (●) Yes ( ) No Is the site significantly disturbed (Atypical Situation)? ( ) Yes (●) No Is the area a potential Problem Area? ( ) Yes (●) No (If needed, explain on reverse.)	Community ID: UPL Transect ID: 1 Plot ID: N/A

VEGETATION

Dominant Plant Species	Stratum	Indicator
1. Trifolium subterraneum (65%)	HERB	
2. Deschampsia danthonioides (15%	HERB	FACW
3. Elatine sp. (5%)	HERB	OBL
4. Poa annua (10%)	HERB	FACW-
5. Ranunculus bonariensis (5%)	HERB	OBL
6.		
7.		
8.		
9.		
10.		
11.		
12.		
13.		
14.		
15.		
16.		

Percent of Dominant Species that are OBL, FACW or FAC (excluding FAC-). 0 %

Remarks: Trifolium subterraneum is not on the list (NL). Dominant vegetation is not hydrophytic.

HYDROLOGY

- [x] Recorded Data (Describe in Remarks):
  - [ ] Stream, Lake, or Tide Gauge
  - [x] Aerial Photographs
  - [ ] Other
- [ ] No Recorded Data Available

Field Observations:

Depth of Surface Water: N/A (in.)

Depth to Free Water in Pit: N/A (in.)

Depth to Saturated Soil: 10.0 (in.)

Wetland Hydrology Indicators:
Primary Indicators:
- [ ] Inundated
- [x] Saturated in Upper 12 Inches
- [ ] Water Marks
- [ ] Drift Lines
- [ ] Sediment Deposits
- [ ] Drainage Patterns in Wetlands

Secondary Indicators (2 or more required):
- [x] Oxidized Root Channels in Upper 12 Inches
- [ ] Water-Stained Leaves
- [ ] Local Soil Survey Data
- [ ] FAC-Neutral Test
- [ ] Other (Explain in Remarks)

Remarks: Wetland hydrology present.

Example Data Forms

SOILS

Map Unit Name
(Series and Phase): Redding loam, 2-8% slopes

Drainage Class: D

Taxonomy (Subgroup): Abruptic Durixeralfs

Field Observations
Confirm Mapped Type? (●) Yes ( ) No

Profile Description:

Depth (inches)	Horizon	Matrix Color (Munsell Moist)	Mottle Colors (Munsell Moist)	Mottle Abundance/ Size/Contrast	Texture, Concretions, Structure, etc.
1-2	O	N/A	N/A	N/A	N/A
2-12	A	5YR 3/4	10 YR 5/1	comm,med, distinct	silt loam

Hydric Soil Indicators:

- ☐ Histosol
- ☐ Histic Epipedon
- ☐ Sulfidic Odor
- ☐ Aquic Moisture Regime
- ☐ Reducing Conditions
- ☐ Gleyed or Low-Chroma Colors
- ☐ Concretions
- ☐ High Organic Content in Surface Layer in Sandy Soils
- ☐ Organic Streaking in Sandy Soils
- ☐ Listed on Local Hydric Soils List
- ☐ Listed on National Hydric Soils List
- ☐ Other (Explain in Remarks)

Remarks: First 1-2 inches consist of mainly organic matter, root zone with no discernible matrix, etc. Hydric soil indicators not present.

WETLAND DETERMINATION

Hydrophytic Vegetation Present?	( ) Yes	(●) No
Wetland Hydrology Present?	( ) Yes	(●) No
Hydric Soils Present?	( ) Yes	(●) No

Is this Sampling Point Within a Wetland? ( ) Yes (●) No

Remarks: Does not meet all three parameters; sampling period occurred during the wet season, hydrology unreliable; upland (UPL).

Approved by HQUSACE 3/92

HYDROLOGY

☑ Recorded Data (Describe in Remarks):
- ☐ Stream, Lake, or Tide Gauge
- ☑ Aerial Photographs
- ☐ Other

☐ No Recorded Data Available

Field Observations:

Depth of Surface Water: N/A (in.)

Depth to Free Water in Pit: N/A (in.)

Depth to Saturated Soil: N/A (in.)

Wetland Hydrology Indicators:

Primary Indicators:
- ☐ Inundated
- ☐ Saturated in Upper 12 Inches
- ☐ Water Marks
- ☐ Drift Lines
- ☐ Sediment Deposits
- ☐ Drainage Patterns in Wetlands

Secondary Indicators (2 or more required):
- ☑ Oxidized Root Channels in Upper 12 Inches
- ☐ Water-Stained Leaves
- ☐ Local Soil Survey Data
- ☐ FAC-Neutral Test
- ☐ Other (Explain in Remarks)

Remarks: Moist but not saturated at 12.0 inches. Wetland hydrologic indicators not present. Does not meet criteria.

Example Data Forms

SOILS

Map Unit Name (Series and Phase): Redding gravelly loam, 0-8% slopes

Drainage Class: D

Taxonomy (Subgroup): Abruptic Durixeralfs

Field Observations Confirm Mapped Type? (•) Yes ( ) No

Profile Description:

Depth (inches)	Horizon	Matrix Color (Munsell Moist)	Mottle Colors (Munsell Moist)	Mottle Abundance/ Size/Contrast	Texture, Concretions, Structure, etc.

Executive Summary

Foothill Associates' biologists synthesized the results of June 12 and 13, 2017, surveys within the 530-acre Study Area and past studies and biological reports to produce an up to date biological resources assessment of The Ranch Project located within the City of Rancho Cordova, California. The Study Area lies immediately east of Rancho Cordova Parkway and a half mile south of Douglas Road. The purpose of this document is to summarize the general biological resources within the Study Area, to assess the suitability of the Study Area to support special-status species and sensitive habitat types, and to provide recommendations for regulatory permitting or further analysis that may be required prior to development activities occurring on the site.

The Ranch site (Study Area) consists of ±530 acres of land that is dominated by annual grassland that is bisected northeast to southwest by an intermittent drainage and interspersed with numerous vernal pools and other seasonal wetlands. Land uses surrounding the Study Area include livestock grazing and residential development.

Known or potential biological constraints in the Study Area include the following:

- Wetlands and other waters of the U.S. subject to Clean Water Act 404/401 and Section 1600 of Fish and Game Code regulations;
- Potential habitat for special-status plants Ahart's dwarf rush, dwarf downingia, pincushion navarretia, and hoary navarretia;
- Potential habitat for western burrowing owl;
- Assumed occupied habitat for federally-listed vernal pool branchiopods; and
- Potential habitat for western spadefoot, American badger, western pond, pallid bat, and nesting birds.

DRAFT

1.0 INTRODUCTION

This report summarizes the findings of previous surveys, studies, and reports as well as 2017 fieldwork completed for the approximate 530-acre Study Area, located within the City of Rancho Cordova, California. This document addresses the onsite physical features, as well as plant communities present and the common plant and wildlife species occurring, or potentially occurring within the Study Area. Furthermore, the suitability of habitats to support special-status species and sensitive habitats are analyzed and recommendations are provided for any regulatory permitting or further analysis required prior to development activities occurring within the Study Area.

1.1. Project Description

The Ranch, also known as Jaeger Ranch, The Preserve, and Sunridge 530, is a ±530-acre parcel located approximately five miles southeast of downtown Rancho Cordova. The Study Area lies immediately east of Rancho Cordova Parkway, north of Kiefer Boulevard, west of Grant Line Road, and south of Douglas Road. The proposed project involves grading portions of the site and filling approximately 6.54 acres of waters of the U.S., including wetlands, to construct a mixed-use development. Proposed development includes: 314.62 acres of low density residential and light commercial development.

DRAFT

2.0 REGULATORY FRAMEWORK

Federal, State, and local environmental laws, regulations, and policies relevant to the California Environmental Quality Act (CEQA) review process are summarized below. The CEQA significance criteria are also included in this section.

2.1. Federal Regulations

2.1.1. Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3)(19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed project, FESA consultation with the U.S. Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) would be initiated if development resulted in take of a threatened or endangered species or if issuance of a Section 404 permit or other federal agency action could result in take of an endangered species or adversely modify critical habitat of such a species.

2.1.2. Migratory Bird Treaty Act

Raptors (birds of prey), migratory birds, and other avian species are protected by a number of State and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior.

2.1.3. The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "*take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof*." Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "*to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to*

an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

2.2. State Jurisdiction

2.2.1. California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW), when preparing CEQA documents. The purpose is to ensure that the State lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction, or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code §2080). CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish & Game Code § 2081).

2.2.2. California Department of Fish and Game Codes

A number of species have been designated "fully protected" species under Sections 5515, 5050, 3511, and 4700 of the Fish and Game Code, but are not listed as endangered (Section 2062) or threatened (Section 2067) species under CESA. Except for take related to scientific research, all take of fully protected species is prohibited. The California Fish and Game Code defines take as "*hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.*" Additionally, Section 3503 of the California Fish and Game Code prohibits the killing of birds or the destruction of bird nests.

2.2.3. Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. There are 64 species, subspecies, and varieties of plants protected under the NPPA. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other Study Areas, changes in land use, and certain other situations require proper advance notification to CDFW.

2.3. Jurisdictional Waters

2.3.1. Federal Jurisdiction

The U.S. Army Corps of Engineers (Corps) regulates discharge of dredge or fill material into waters of the U.S. under Section 404 of the Clean Water Act (CWA). "Discharges of fill material"

DRAFT

is defined as the addition of fill material into waters of the U.S., including, but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; Study Area-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes and subaqueous utility lines [33 C.F.R. §328.2(f)].

Waters of the U.S. include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, and wet meadows. Boundaries between jurisdictional waters and uplands are determined in a variety of ways depending on which type of waters is present. Methods for delineating wetlands and non-tidal waters are described below.

- Wetlands are defined as "*those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions*" [33 C.F.R. §328.3(b)]. Presently, to be a wetland, a Study Area must exhibit three wetland criteria: hydrophytic vegetation, hydric soils, and wetland hydrology existing under the "normal circumstances" for the Study Area.
- The lateral extent of non-tidal waters is determined by delineating the ordinary high water mark (OHWM) [33 C.F.R. §328.4(c)(1)]. The OHWM is defined by the Corps as "*that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas*" [33 C.F.R. §328.3(e)].

An aquatic feature is determined to be a water of the U.S. based on nexus with a traditionally navigable water pursuant to the Supreme Court's decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (126 S. Ct. 2208) and agency guidance subsequent to this decision. Under these rules, the Corps asserts jurisdiction over wetlands adjacent to traditional navigable waters, relatively permanent non-navigable tributaries (i.e., waters that have a continuous flow at least three months out of the year), and wetlands that abut relatively permanent tributaries. The Corps determines jurisdiction over waters that are non-navigable tributaries that are not relatively permanent, and wetlands adjacent to these tributaries, by making a determination whether such waters "significantly affect the chemical, physical, and biological integrity of other jurisdictional waters more readily understood as "navigable." Finally, the Corps generally does not consider the following to be "waters of the United States": swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent or short duration flow) and ditches "wholly in and draining only uplands…which do not carry a relatively permanent flow of water." Navigable waters of the United States are defined as waters that have been used in the past, are now used, or are susceptible to use as a means to transport interstate or foreign commerce up to the head of navigation.

DRAFT

2.3.2. State Jurisdiction

Regional Water Quality Control Boards

Discharges of fill or waste material to waters of the State are regulated by the State Water Resources Control Board (SWRCB) through its Regional Water Quality Control Boards (RWQCB) under Section 401 of the CWA and the Porter-Cologne Water Quality Control Act (contained in the California Water Code). All waters of the U.S. are also considered waters of the State. In addition, other aquatic features that are not subject to Corps' jurisdiction, such as roadside ditches or isolated wetlands, may be considered waters of the State. This determination will be made by RWQCB staff on a case-by-case basis.

Section 401 of the CWA requires an applicant to obtain "water quality certification" to ensure compliance with State water quality standards before certain federal licenses or permits may be issued. Section 13260(a) of the Porter-Cologne Water Quality Control Act requires any person discharging waste, including dredged or fill material, or proposing to discharge waste, other than to a community sewer system, within any region that could affect the quality of the waters of the State (all surface and subsurface waters) to file a report of waste discharge. The permits subject to Section 401 include CWA Section 404 permits issued by the Corps. Waste discharge requirements under the Porter-Cologne Water Quality Control Act were typically waived for projects that required certification. Discharges to waters of the State that are not subject to a CWA Section 404 permit rely on the report of waste discharge process.

California Department of Fish and Wildlife

The CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq.* of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "*substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds…except when the department has been notified pursuant to Section 1601.*" Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over 4-inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

2.4. CEQA Significance

Section 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist contained in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these

DRAFT

examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery Study Areas;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and
- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

2.4.1. California Native Plant Society

The California Native Plant Society (CNPS) maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS ranks:

- Rank 1A: Plants presumed Extinct in California
- Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere
- Rank 2: Plants Rare, Threatened, or Endangered in California, but more numerous elsewhere

DRAFT

- Rank 3: Plants about which we need more information – A Review List
- Rank 4: Plants of limited distribution – A Watch List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under CEQA.

2.4.2. California Department of Fish and Wildlife Species of Concern

Some additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or are fully protected. These species are included on the *Special Animals List*, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the *Special Animals List* includes species that are tracked in the California Natural Diversity Database (CNDDB), but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

2.5. Draft South Sacramento Habitat Conservation Plan

The draft *South Sacramento Habitat Conservation Plan* (SSHCP) was released in February 2017. Its purpose is to streamline State and federal permitting processes for covered development projects that take place within signatory municipalities. It aims to protect habitat, open space, and agricultural lands through a number of Biological Goals, Measurable Objectives, and Conservation Actions enumerated in *Chapter 7 – Conservation Strategy* included in **Appendix A** (County of Sacramento 2017). The Ranch Project would fall under the jurisdiction of the SSHCP, if implemented, for purposes of estimating impacts to covered species and for estimating mitigation costs.

2.6. City of Rancho Cordova General Plan

In addition to the federal and State regulations described above, the *City of Rancho Cordova General Plan* (General Plan) identifies goals, objectives, and policies to provide further protection to biological resources within the County's limits (City of Rancho Cordova 2006). Applicable General Plan policies are summarized below and included in **Appendix A**.

The General Plan's *Natural Resources Element* aims to identify "*the ways in which Rancho Cordova will protect, maintain, and enhance its natural resources*" enumerated by list of goals. Goal NR.1 seeks to "*protect and preserve diverse wildlife and plant habitat, including habitat for special status species.*" Goals NR.2 and NR.3 seek to preserve the areas wetlands and creek corridors. These goals are achieved through a number of policies and action items as described in the *Natural Resources Element* included in **Appendix A**.

DRAFT

3.0 METHODS

Available information pertaining to the natural resources of the region was reviewed. All references reviewed for this assessment are listed in the **References** section. The following site-specific information was reviewed:

- California Department of Fish and Wildlife (CDFW). 2017. *California Natural Diversity Data Base* (CNDDB: *Citrus Heights, Folsom, Clarksville, Carmichael, Buffalo Creek, Folsom SE, Elk Grove, Sloughhouse, Carbondale* U.S. Geological Survey (USGS) 7.5-minute series quadrangles), Sacramento, CA. Accessed [07/11/2017] (**Appendix B**);
- California Native Plant Society (CNPS). 2017. *Inventory of Rare and Endangered Plants* (online edition, v8-02) (CNPS: *Citrus Heights, Folsom, Clarksville, Carmichael, Buffalo Creek, Folsom SE, Elk Grove, Sloughhouse, Carbondale* quadrangles). Accessed [07/11/2017] (**Appendix B**);
- U.S. Fish and Wildlife Service (USFWS). 2017. *Information for Planning and Conservation* (IPaC) *Trust Resource Report: The Ranch, Sacramento County*. Accessed [07/11/2017] (**Appendix B**);
- U.S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS). 2017. *Web Soil Survey*. Available online at: http://websoilsurvey.sc.egov.usda.gov/App/HomePage.html. Accessed [07/12/2017];
- U.S. Geological Survey. 1967. Photorevised 1980. *Buffalo Creek, California*. 7.5-minute series topographic quadrangle. United States Department of Interior; and
- Biological reports and associated documents previously prepared for the Study Area.

Prior to conducting a survey of the Study Area, existing information, including *The Ranch at Sunridge Project: Section 7 Biological Assessment* (Foothill Associates 2012), *Jaeger ±530-Acre Study Area: Wetland Delineation Report* (Foothill Associates 2005), *Special Status Plant Report ±530-Acre Peery Arrillaga Sunrise Douglas Site* (North Fork Associates 2002), and rare plant survey letter reports prepared by Foothill Associates in 2009 and 2017 for the Study Area were reviewed. The results of the special-status species records search and five-mile radius CNNDB query are summarized in **Appendix B**. The most recent field surveys of the Study Area were conducted on June 12 and 13, 2017. The Study Area was systematically surveyed on foot with binoculars to ensure total search coverage, with special attention given to identifying those portions of the Study Area with the potential for supporting special-status species and sensitive habitats. During the field surveys, biologists recorded plant and animal species observed (**Appendix C**), as well as characterized biological communities occurring within the Study Area. Wetland features were previously delineated within the Study Area and verified by the Corps in 2014 (Corps 2014). Wetland polygons along the eastern boundary of Rancho Cordova Parkway were remapped in 2017 to address impacts that may have occurred during expansion of Rancho Cordova Parkway.

DRAFT

Following the Study Area survey, the potential for each species identified in the records search to occur in the Study Area was determined based within the Study Area surveys, soils, and species-specific information, as shown in **Appendix B**.

DRAFT

4.0 RESULTS

4.1. Study Area Location and Description

The Study Area is located in the City of Rancho Cordova north of Kiefer Boulevard, east of Rancho Cordova Parkway, south of Douglas Road, and west of Grant Line Road. Land uses surrounding the Study Area include residential developments to the north and west and rangeland to the south and east. The Study Area is located within Section 16, Township 8 North, Range 7 East, of the USGS 7.5-minute series *Buffalo Creek, California* quadrangle. The approximate location of the center of the Study Area is 38° 32' 43.93" North, 121° 12' 55.20" West (**Figure 1**).

The Study Area consists of ±530 acres of land that is currently used for livestock grazing.

4.2. Physical Features

4.2.1. Topography and Drainage

The general topography of the Study Area is gently undulating, generally sloping in a westerly direction with elevations ranging from 200 feet above mean sea level (MSL) at points along the eastern boundary of the Study Area to 170 feet above MSL in the central drainage channel at the western boundary of the Study Area (52 – 61 meters). The Study Area is crossed by an unnamed intermittent drainage that runs northeast to southwest and flows off the Study Area under Rancho Cordova Parkway and into Anatolia Preserve. The Study Area also contains numerous depressional and riverine wetlands. Water leaves the Study Area through the intermittent drainage as well as over land and through small riverine wetlands on the eastern and southern portions of the Study Area. Water enters the Study Area through the intermittent drainage as well as through seasonal precipitation.

The Study Area is located in the Upper Morrison Creek and Laguna Creek Watersheds. The Upper Morrison Creek Watershed encompasses approximately 50 square miles. Its main drainage, Morrison Creek, flows approximately 20 miles from the foothills in the east through the cities of Rancho Cordova and Sacramento. It drains into the Sacramento River. The Laguna Creek Watershed encompasses approximately 45 square miles. Its main drainage, Laguna Creek, flows 25 miles from the foothills in the east through the cities of Rancho Cordova, Elk Grove, and Sacramento. Historically a seasonal drainage, Laguna Creek now carries water throughout much of the year due to urban and agricultural runoff caused by increasing urbanization of the watershed in southern Sacramento County. Laguna Creek drains to Morrison Creek and ultimately to the lower Sacramento River.

4.2.2. Soils

The Natural Resources Conservation Service (NRCS) has mapped five soil units within the Study Area (**Figure 2**). The soil units that occur on Study Area include: **Fiddyment Fine Sandy Loam, 1 to 8 Percent Slopes**, **Hicksville Gravelly Loam, 0 to 2 Percent Slopes, Occasionally Flooded**, **Red Bluff-Redding Complex, 0 to 5 Percent Slopes**, **Redding Gravelly Loam, 0 to 8 Percent Slopes**,

DRAFT

and **Redding Loam, 2 to 8 Percent Slopes**. General characteristics associated with these soils types are described below.

- **Fiddyment Fine Sandy Loam, 1 to 8 Percent Slopes**: This moderately deep, well-drained soil is located on hills between 50 and 350 feet above MSL. This soil formed in material weathered from consolidated sandstone or siltstone. Permeability is very slow and available water capacity is low. As a result, this soil type takes a very long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil unit is typically used for rangeland, irrigated hay and pasture, or for dryland crops, such as wheat. Typically, vegetation on this soil unit consists mainly of non-native grasses and herbaceous plant species. The hydric soils list for Sacramento County does not identify any hydric inclusions occurring within this soil type.
- **Hicksville Gravelly Loam, 0 to 2 Percent Slopes, Occasionally Flooded**: This very deep, moderately well-drained soil is on low stream terraces and the alluvial flats adjacent to drainageways on high terraces and hills between 75 to 230 feet above MSL. This soil unit formed in alluvium derived from mixed rock sources. Permeability is moderately slow in this soil type and available water capacity is low. As a result, this soil type takes a moderately long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil type is typically used as rangeland or for irrigated crops. Typically, vegetation on this soil unit consists mainly of non-native grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies two hydric inclusions occurring within this soil type, Columbia and Hicksville.
- **Red Bluff-Redding Complex, 0 to 5 Percent Slopes**: This soil complex is located on high terraces, between 90 to 310 feet above MSL. The Red Bluff soil is very deep and well drained. This soil formed in alluvium derived from mixed rock sources. This soil complex consists of approximately 45 percent Red Bluff soil and 40 percent Redding soil. Permeability is moderately slow and available water capacity is high in the Red Bluff soil. As a result, this soil type takes a moderately long time to saturate and the capacity of the soil to hold water available for use by most plant species is high. The Redding soil is moderately deep and moderately well drained. Permeability is very slow in the Redding soil and available water capacity is low. As a result, this soil type takes a long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil complex is used mainly as rangeland or to cultivate dry land crops, such as wheat. Typically, vegetation on this soil complex consists of non-native annual grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type.
- **Redding Gravelly Loam, 0 to 8 Percent Slopes**: This moderately deep, well-drained soil type is located on high terraces and terrace remnants between 40 to 390 above MSL. This soil formed in gravelly and cobbled alluvium derived from mixed rock sources. Permeability is slow in Redding gravelly loam and available water capacity is low. As a result, this soil type takes a long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil unit is mainly used as rangeland for livestock grazing. In some areas this unit is used for irrigated hay and

DRAFT

pasture or for dryland crops, such as wheat. Typically, vegetation on this soil unit consists of non-native annual grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type.

- **Redding Loam, 2 to 8 Percent Slopes**: This moderately deep, moderately well-drained soil is on high terraces and terrace remnants between 40 to 170 feet above MSL. This soil formed in gravelly and cobbly alluvium derived from mixed rock sources. Permeability is very slow in the Redding soil and available water capacity is low. As a result, this soil type takes a long time to saturate and the capacity of the soil to hold water available for use by most plant species is low. This soil type is typically used for rangeland and less frequently for dryland crops, such as wheat, or irrigated crops, such as hay. Typically, vegetation on this soil unit consists of non-native annual grasses and herbaceous plant species. The hydric soils list for Sacramento County identifies one unnamed hydric inclusion found within depressions of this soil type.

4.3. Biological Communities

The primary terrestrial biological community that occurs within the Study Area is annual grassland. The following aquatic biological communities also occur within the Study Area: seasonal wetlands (depressional and riverine), vernal pools, intermittent drainage, seasonal wet swale, and a detention basin outfall. These communities provide habitat to a number of common species of wildlife and may provide suitable habitat for special-status species. Dominant vegetation observed within each biological community is discussed in detail below. A comprehensive list of plants observed within the Study Area is provided in **Appendix C**. The location and extent of each biological community are depicted in **Figure 3**.

4.3.1. Annual Grassland

The plant community covering the majority of the Study Area is annual grassland, which accounts for approximately 506.07 acres of the Study Area and is characterized primarily by an assemblage of non-native grasses and forbs. Much of the vegetation in these communities is common to the Central Valley. Dominant grass species consists of Italian rye grass (*Festuca perennis*), rattail sixweeks grass (*Festuca myuros*), soft brome (*Bromus hordeaceus*), and slender wild oat (*Avena fatua*). Common dominant herbaceous non-natives include jointed charlock (*Raphanus raphanistrum*) and field bindweed (*Convolvulus arvensis*).

Annual grassland habitat supports breeding, foraging, and shelter habitat for several species of wildlife. Species expected to occur in this habitat include savannah sparrow (*Passerculus sandwichensis*), western meadowlark (*Sturnella neglecta*), black-tailed jackrabbit (*Lepus californicus*), and gopher snake (*Pituophis melanoleucus*).

4.3.2. Developed/Disturbed

A total of 2.45 acres of the Study Area is classified as developed/disturbed. This acreage is composed of paved and unpaved roads and an existing structure, a utility shed located in the northern-central portion of the Study Area. These areas primarily contain ruderal (weedy)

DRAFT

vegetation but may provide nesting or roosting substrate for some wildlife species such as birds and bats.

4.3.3. Seasonal Wetland

Seasonal wetlands account for 4.58 acres of the Study Area. The seasonal wetlands are depressional or riverine. Depressional seasonal wetlands consist of topographic folds that inundate or flow for short periods of time following intense rains, but do not maintain seasonal aquatic or saturated soils conditions for durations long enough for colonization by perennial, obligate plant species. Riverine seasonal wetlands occur in linear topographic depressions and are characterized by flowing water.

Dominant vegetation occurring within the seasonal wetlands includes: coyote thistle (*Eryngium vaseyi*), rabbitsfoot grass (*Polypogon monspeliensis*), hyssop loosestrife (*Lythrum hyssopifolia*), annual hairgrass (*Deschampsia danthonioides*), and Fremont's goldfields (*Lasthenia fremontii*).

4.3.4. Vernal Pool

Vernal pools account for 15.04 acres of the Study Area. Vernal pools are shallow, seasonally inundated depressional wetlands that form in soils with a subsurface layer that restricts the downward flow of water. Dominant vegetation within these features includes: coyote thistle, Mediterranean barley, and stalked popcornflower (*Plagiobothrys stipitatus*).

4.3.5. Intermittent Drainage

Intermittent drainages account for 1.54 acres of the Study Area. Intermittent drainages are features that may not meet the three-parameter criteria for vegetation, hydrology, and soils, but do convey water and exhibit an ordinary high water mark. Water flows within intermittent drainages are fed primarily by precipitation and stormwater runoff. Dominant vegetation within the intermittent drainages consists of coyote thistle.

4.3.6. Seasonal Wet Swale

The seasonal wet swale accounts for 0.06 acres of the Study Area and is located at the center of the southern boundary of the Study Area. Seasonal wet swales are not considered jurisdictional waterbodies, but do convey and hold water during and after storm events and can exhibit assemblages of wetland vegetation. Dominant vegetation of seasonal wet swales typically consists of grass and other wetland vegetation.

4.3.7. Detention Basin Outfall

The detention basin outfall accounts for 2.92 acres of the Study Area and is located near the eastern end of the northern border. The detention basin outfall is a manmade feature designed to convey periodic excesses of water from a reservoir along the eastern end of the northern border of the Study Area to the intermittent drainage that bisects the Study Area. Conveyed water drains through tailings placed at the southern end of the basin outfall. Aquatic species that may be present in the adjacent intermittent drainage are obstructed from entering the detention basin outfall. The detention basin outfall is heavily managed and receives periodic

DRAFT

high-intensity disturbance – the surface of the detention basin outfall is bare earth and is routinely scraped to remove all vegetation. It is not considered to be sensitive habitat or provide habitat for any special-status species.

4.4. Special-Status Species

Special-status species are plant and animal species that have been afforded special recognition by federal, State, or local resource agencies or organizations. Listed and special-status species are of relatively limited distribution and may require specialized habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under CESA or FESA;
- Protected under other regulations (e.g. Migratory Bird Treaty Act);
- Included on the CDFW Special Animals List;
- Identified as Rank 1-4 by CNPS; or
- Receive consideration during environmental review under CEQA.

Special-status species considered for this analysis are based on queries of the CNDDB, the USFWS, and CNPS ranked species (online versions) for the *Buffalo Creek, California* and eight surrounding quadrangles. **Appendix B** includes the common name and scientific name for each species, regulatory status (federal, State, local, CNPS), habitat descriptions, and potential for occurrence in the Study Area. The following set of criteria has been used to determine each species' potential for occurrence in the Study Area:

- **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological surveys.
- **High**: Species known to occur on or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area.
- **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area **-OR-** Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat within the Study Area.
- **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -**OR-** Species was surveyed for during the appropriate season with negative results **-OR-** The Study Area occurs outside of the known elevation or geographic ranges.

Only those species that are known to be *present* or have a *high* or *low* potential for occurrence are discussed further in the following sections.

DRAFT

4.4.1. Listed and Special-Status Plants

According to the records search, 25 special-status plant species have the potential to occur on or in the vicinity of the Study Area. Based on field observations and literature review, four species were determined to have the potential for occurrence to occur within the Study Area. The following species are considered to have a *low* potential within the Study Area: Ahart's dwarf rush (*Juncus leiospermus* var. *ahartii*) dwarf downingia (*Downingia pusilla*), pincushion navarretia (*Navarretia myersii* ssp. *myersii*), and hoary navarretia (*Navarretia eriocephala*).

Plant Species with a Low Potential for Occurrence

Ahart's dwarf Rush

Ahart's dwarf Rush is ranked as a CNPS 1B species, which indicates that this species is rare, threatened, or endangered in California and elsewhere. It is a small annual herb that is found in vernal pool margins and grassland from 100 to 330 feet (30 to 100 meters) above MSL. The identification period is March through May. The vernal pools and grassland of the Study Area provide habitat for this species. Though this species has not been observed within the Study Area during previous site visits, there are two CNDDB records for this species within five miles of the Study Area (CDFW 2017). Therefore, this species has a *high* potential to occur within the Study Area.

Dwarf Downingia

Dwarf downingia is ranked as a CNPS 2B species, which indicates that this species is rare, threatened, or endangered in California but is more common elsewhere. It is an annual herb found in mesic areas within valley and foothill grassland and vernal pools from 3 to 1,460 feet (1 to 445 meters) above MSL. The identification period for this species is from March through May. There are no documented CNDDB records of this species occurring within five miles of the Study Area (CDFW 2017). This species has the potential to occur within the non-native annual grassland and vernal pools within the Study Area. There is a *low* potential for this species to occur within the non-native annual grassland and vernal pools within the Study Area.

Pincushion Navarretia

Pincushion navarretia is ranked as a CNPS 1B species. It is an annual herb found in vernal pools, which are often acidic from 66 to 1,083 feet (20 to 330 meters) above MSL. The identification period for this species is from April through May. There are no documented CNDDB records of this species occurring within five miles of the Study Area (CDFW 2017). This species has the potential to occur within the vernal pools within the Study Area. There is a *low* potential for this species to occur within the vernal pools within the Study Area.

Hoary Navarretia

Hoary navarretia is ranked as a CNPS 4 species. It is an annual herb found in mesic areas of mixed pine woodland, oak woodland, and grassland from 350 to 1,300 (105 to 400 meters) above MSL. The identification period for this species is from May through June. There are no documented CNDDB records of this species occurring within five miles of the Study Area (CDFW

DRAFT

2017). This species has the potential to occur within the grassland of the Study Area. There is a *low* potential for this species to occur within the Study Area.

4.4.2. Listed and Special-Status Wildlife

According to the records search, 50 special-status wildlife species have the potential to occur within the Study Area or in the vicinity. Based on field observations and literature review, 24 species were determined to have the potential to occur in the Study Area. Species that are known to be *present* or that are considered to have a *high* potential to occur within the Study Area include: vernal pool fairy shrimp (*Branchinecta lynchi*), vernal pool tadpole shrimp (*Lepidurus packardi*), ferruginous hawk (*Buteo regalis*), golden eagle (*Aquila chrysaetos*), white-tailed kite (*Elanus leucurus)*, California linderiella (*Linderiella occidentalis*), western burrowing owl (*Athene cunicularia*), and western spadefoot (*Spea hammondii*). Species that are considered to have a I potential to occur within the Study Area include: grasshopper sparrow (*Ammodramus savannarum*), loggerhead shrike (*Lanius ludovicianus*), merlin (*Falco columbarius*), mountain plover (*Charadrius montanus*), short-eared owl (*Asio flammeus*), American badger (*Taxidea taxus*), pallid bat (*Antrozous pallidus*), blennosperma vernal pool andrenid bee (*Andrena blennospermatis*), an unnamed andrenid bee (*Andrena subapasta*), Ricksecker's water scavenger beetle (*Hydrochara ricksecker*i), hairy water flea (*Dumontia oregonensis*), and mid-valley fairy shrimp (*Branchinecta mesovallensis*).

Wildlife Species with a High Potential for Occurrence

Western Burrowing Owl – State Species of Concern

Western burrowing owl is a small ground-dwelling owl that occurs in western North America from Canada to Mexico, and east to Texas, and Louisiana. Although in certain areas of its range western burrowing owls are migratory, these owls are predominantly non-migratory in California (Zeiner *et. al.* 1990). The breeding season for western burrowing owls occurs from February to August, peaking in April and May (Zeiner *et. al.* 1990). Western burrowing owls nest in burrows in the ground, often in old ground squirrel burrows. This owl is also known to use artificial burrows including pipes, culverts, and nest boxes. There are 12 CNDDB records for this species within five miles of the Study Area (CDFW 2017), though no western burrowing owls were observed during site visits. The Study Area contains suitable burrows to support this species. Therefore, this species has as a *high* potential for occurrence.

Golden Eagle—California Fully Protected

Golden eagles live in semi-open habitats where they have easy access to their primary prey of small to medium-sized mammals. Grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats provide necessary foraging habitat. Nests are placed on cliffs or large trees and are maintained year and after year. Breeding occurs from January through August. Golden eagle home range territories are estimated to average 48 square miles in northern California (Zeiner *et al.* 1990). Breeding territories range from 8 to 21 square miles, or three to five miles surrounding the nest, but activity is often concentrated in a smaller core area. Although only one nest is used each year, a territory may contain multiple alternate nests. There is one CNDDB record of golden eagle documented within five miles of the Study Area

DRAFT

(CDFW 2017). No golden eagles were observed during previous site visits. Although the Study Area does not provide suitable nesting trees, the non-native annual grassland provides foraging habitat for this species. Therefore, this species has as a *high* potential for occurrence.

White-tailed Kite—California Fully Protected

White-tailed kite is listed as California Fully Protected. White-tailed kite is a year-long resident in coastal and valley lowlands in California. White-tailed kite breed from February to October, peaking from May to August (Zeiner *et. al.* 1990). This species nests near the top of dense oaks, willows, or other large trees. There are three CNDDB records of white-tailed kite documented within five miles of the Study Area (CDFW 2017). One white-tailed kite was observed foraging within the annual grassland during the June 12, 2017 rare plant survey. The annual grassland provides suitable foraging habitat for this species. Therefore, this species is considered to be *present* within the Study Area.

Nesting Birds and Raptors

The nests of raptors and most other birds are protected under the MBTA. Raptors are also protected by Section 3503.5 of the California Fish and Game Code, which makes it illegal to destroy any active raptor nest. Additionally, the USFWS and CDFW identified a number of avian species of conservation concern that do not have specific statutory protection. Avian species forage and nest in a variety of habitats throughout Sacramento County. As shown in **Appendix B**, the annual grassland on and surrounding the Study Area may provide nesting and foraging habitat for raptors and other protected birds, including: ferruginous hawk, grasshopper sparrow, merlin, mountain plover, and short-eared owl. Raptors and other protected migratory birds have a *high* potential to occur in the Study Area.

Vernal Pool Branchiopods with High Potential for Occurrence

The records search indicated that three species of vernal pool branchiopods occur within five miles of the Study Area: vernal pool fairy shrimp (*Branchinecta lynchi*), a federally threatened species, vernal pool tadpole shrimp (*Lepidurus packardi*), a federally endangered species, and California linderiella (*Linderiella occidentalis*), a California Special Animal. These species require continuous inundation typically ranging from six to eight weeks to complete their lifecycle (Nature Serve 2017). The vernal pools in the Study Area provide habitat for these species and there are 22 known CNDDB occurrences of vernal pool fairy shrimp, 43 CNDDB occurrences of vernal pool tadpole shrimp, and 25 CNDDB occurrences of California linderiella within five miles of the Study Area (CDFW 2017); therefore, these species a *high* potential for occurrence within the Study Area.

Western Spadefoot

Western spadefoot occurs throughout the Central Valley and on the coast from Point Conception, south to the Mexican border. This species occurs from sea level up to 4,500 feet (0 to 1400 meters) above MSL in the southern Sierra foothills. Western spadefoot individuals are most commonly found in grassland habitats with temporary pools of water, but they have also been found in open chaparral and valley-foothill pine-oak woodlands (Stebbins 2003). This species spends most of the year underground, where individuals seek refuge from desiccating

DRAFT

by constructing and residing in small burrows. This species often breeds in temporary pools and quiet streams between the months of January and May that remain inundate for at least six weeks. The vernal pools and depressional seasonal wetlands in the Study Area provide breeding habitat and there is one known occurrence within five miles of the Study Area (CDFW 2017). Therefore, this species has a *high* potential to occur within the Study Area.

Wildlife Species with a Low Potential for Occurrence

American Badger—California Species of Concern, Species of Local Concern

American badger is a California Species of Special Concern. American badgers are found in dry, open habitats including grassland and open woodland. Suitable burrowing habitat requires dry, sandy soil. Breeding occurs in summer and early fall, with young being born from March to April (Nature Serve 2017). There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017). The annual grassland and burrows provides marginal habitat for this species given the lack of sandy soils within the Study Area. No American badgers were observed during the biological surveys. Therefore, this species has a *low* potential to occur within the Study Area.

Pallid Bat—California Species of Concern

California is home to several special-status bat species, including the pallid bat. Bat numbers are in decline throughout the U.S. due to loss of roosting habitat, habitat conversion, and habitat alteration. There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017). No bat species were observed roosting during previous site visits. The sparse man-made structures, including utility towers and a utility shed in the center of the Study Area, provide marginal day roosting habitat and the annual grassland provides foraging habitat for this species. Therefore, this species has a *low* potential to roost within the Study Area and could utilize the Study Area for foraging.

Vernal Pool Branchiopods with Low Potential for Occurrence

The records search indicated that two species of vernal pool branchiopods other than those listed above have the potential to occur within the Study Area or vicinity: Mid-valley fairy shrimp (*Branchinecta mesovallensis*), a California Special Animal, and hairy water flea (*Dumontia oregonensis*), a California Special Animal (CDFW 2017). These species require continuous inundation typically ranging from six to eight weeks to complete their lifecycle (Nature Serve 2017). The vernal pools in the Study Area provide habitat for these species though there are no CNDDB occurrences within five miles of the Study Area for either species. Therefore, these species have a *low* potential for occurrence within the Study Area.

Blennosperma Vernal Pool Andrenid Bee and Unnamed Andrenid Bee—California Special Animals

The blennosperma vernal pool andrenid bee and another Andrenid Bee without a common name (*Andrena subapasta*) are small, ground-nesting bees found in the upland areas near vernal pools wherever blennosperma flowers and other grassland forbs are present. They are generally slender and dark-olive green with pale apical bands on the dorsum of the metasomal segments. The species were not observed during previous site visits. The uplands and vernal

DRAFT

pools may provide habitat for these species if they support blennosperma populations other appropriate grassland forbs; however, there are no known CNDDB occurrences within five miles of the Study Area (CDFW 2017). Therefore, these species have a *low* potential to occur within the Study Area.

Ricksecker's Water Scavenger Beetle—California Special Animal

Ricksecker's water scavenger beetle is an aquatic beetle that is a California Special Animal. This species inhabits a wide variety of aquatic habitats, including creeks and shallow ponds. The waterbodies within the Study Area provide potential habitat for this species, though this species has not been observed within the Study Area during previous site visits. There are no CNDDB occurrences for this species within five miles of the Study Area. Therefore, this species has a *low* potential to occur within the Study Area.

4.5. Sensitive Habitats

Sensitive habitats include those that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code, and/or Sections 401 and 404 of the Clean Water Act. Additionally, sensitive habitats are protected under the specific policies outlined in the proposed *South Sacramento Habitat Conservation Plan*. Sensitive habitats known to occur within the Study Area, which include aquatic features are vernal pools, seasonal wetlands, seasonal swale, and intermittent drainage.

4.5.1. Jurisdictional Waters of the U.S. and State

Jurisdictional waters of the U.S. and State located in the Study Area total approximately 22 acres. This acreage includes depressional seasonal wetlands (2.92 acres), vernal pools (15.04 acres), riverine seasonal wetlands (1.66 acres), intermittent drainages (1.54 acres), and seasonal wet swale (0.06 acres) (**Figure 3**). To date, potential wetland areas in the Study Area have been formally delineated and the Corps has verified these acreages. As discussed in **Section 2.3**, jurisdictional waters of the U.S. are subject to Section 404 of CWA and are regulated by the Corps.

DRAFT

5.0 CONCLUSIONS AND RECOMMENDATIONS

As discussed, the Study Area consists of land that supports primarily annual grassland, developed/disturbed, seasonal wetlands, vernal pools, intermittent drainage, and seasonal wet swale. **Table 1** summarizes the biological communities and expected impacts from the proposed project. Proposed project impacts are shown in **Figure 4**.

TABLE 1 — IMPACTS TO BIOLOGICAL COMMUNITIES

Habitat Types	Project Impacts	Previously Permitted Impacts	City (CIP) Impacts	SSHCP Buffer Acreage	Preserved Acreage	Total Acreage
Wetlands						
Depressional Seasonal Wetland	1.04	—	—	0.03	1.85	2.92
Vernal Pool	4.75	0.02	0.18	0.12	9.97	15.04
Riverine Seasonal Wetland	0.51	0.01	—	<0.01	1.15	1.66
Intermittent Drainage	—	<0.01	—	—	1.53	1.54
Seasonal Wet Swale	0.06	—	—	—	—	0.06
Detention Basin Outfall	—	—	—	—	0.30	0.30
Biological Communities						
Annual Grassland	305.15	—	0.51	13.16	187.16	506.07
Developed/Disturbed	2.43	—	—	—	0.03	2.45
Total	**313.93**	**0.03**	**0.69**	**13.31**	**201.98**	**530.05**

Note: Acreage may not add across rows or columns due to rounding.

Known or potential biological constraints in the Study Area include the following:

- Wetlands and other waters of the U.S. subject to Clean Water Act 404/401 and Section 1600 of Fish and Game Code regulations;
- Potential habitat for special-status plants Ahart's dwarf rush, dwarf downingia, pincushion navarretia, and hoary navarretia;
- Potential habitat for western burrowing owl;
- Assumed occupied habitat for federally-listed vernal pool branchiopods; and
- Potential habitat for western spadefoot, American badger, western pond turtle, pallid bat, and nesting birds.

DRAFT

5.1. Special-Status Plant Species

As discussed previously, portions of the Study Area contain suitable habitat for four special-status plant species that are known to occur in the vicinity and were not the targets of the June 12 and 13, 2017 botanical survey. The non-listed special-status species include Ahart's dwarf rush, dwarf downingia, pincushion navarretia, and hoary navarretia. Ground disturbance associated with the project would result in the temporary disturbance of 0.09 acres and permanent removal of 318.82 acres of annual grassland, which provides habitat for potentially occurring special-status plants. Temporary disturbance and permanent removal would impact special-status plants, if present, through removal of individuals and elimination of their habitat.

Since the June 12 and 13 botanical survey was not conducted during the bloom period when these species are identifiable, prior to construction a qualified botanist should conduct a botanical survey in May when all four potentially occurring special-status plant species will be within their evident and identifiable bloom period as specified by Avoidance and Mitigation Measure (AMM) PLANT-1 in the SSHCP. The results of these surveys should be documented in a letter report to City of Rancho Cordova. If no special-status plants are observed during the recommended botanical surveys, no additional measures are recommended.

If any special-status plant covered by the SSHCP are identified within 250 feet of areas of potential construction disturbance, they should be avoided to the extent feasible. If they cannot be avoided, the Implementing Entity will assure one unprotected occurrence of the species is protected within a SSHCP Preserve before any ground disturbance occurs at the project site in accordance with SSHCP AMM PLANT-2. If any federally-listed plants not covered by the SSHCP are identified within areas of potential construction disturbance, they should be avoided to the extent feasible. If the federally-listed plants cannot be avoided, Section 7 consultation would be required and a biological opinion from the USFWS would need to be obtained prior to transplantation and commencement of construction activities. Similarly, if any state-listed plants not covered by the SSHCP occur within the project footprint, they should be avoided to the extent feasible. If the state-listed plants cannot be avoided, an Incidental Take Permit would be required from the CDFW. Additional measures may be required through the consultation process with the CDFW and/or the USFWS, including compensatory mitigation or transplanting and monitoring.

5.2. Western Spadefoot

No western spadefoot toads were observed during previous site visits. However, the annual grassland provides suitable upland habitat and vernal pools provide suitable breeding habitat for this species. Vegetation clearing within the annual grassland and filling of the vernal pools could impact this species if present. In addition, construction equipment and vehicle movement could impact these species if present within the project footprint.

Western spadefoot is a covered species under the SSHCP and there are six AMMs that apply to this species. If covered activities must be implemented during the wet season (October 15 through May 15), exclusion fencing must be installed around the project footprint, temporary high-visibility construction fencing must be installed along the edge of work areas, and silt

DRAFT

fencing must be installed immediately behind the temporary high-visibility construction fencing to exclude western spadefoot per AMM WS-2. Additionally, the project site must be monitored daily by an approved biologist and construction personnel must be trained on the required avoidance measures per AMM WS-3. AMM WS-4 stipulates that all excavated steep-walled holes and trenches greater than six inches deep must be covered with plywood to avoid western spadefoot entrapment. AMM WS-5 specifies that BMP-2, if implemented, must be implemented using non-entangling erosion control material such as coconut coir matting and fiber rolls containing burlap. If a western spadefoot is encountered during construction activities, the approved biologist must notify the CDFW immediately and construction activities must be suspended within a 100-foot radius of the animal until the animal leaves the project site on its own volition as required by AMM WS-6.

5.3. American Badger

The annual grassland provides habitat for American badger. A qualified biologist should conduct a pre-construction survey for American badger within 14 days prior to the start of ground disturbance. If no American badgers are observed, then a letter report documenting the results of the survey should be provided to the project proponent for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If American badgers or their dens are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a Worker Awareness Training to all construction workers, and being present on the Study Area during grading activities for the purpose of temporarily halting construction activities until the biologist determines that the badger has left the construction footprint on its own accord.

5.4. Vernal Pool Branchiopods

As discussed previously, vernal pools in the Study Area represent potential habitat for special-status invertebrate species including mid-valley fairy shrimp, vernal pool fairy shrimp, California linderiella, hairy water flea, and vernal pool tadpole shrimp. The USFWS typically considers vernal pool branchiopod habitat to be indirectly impacted by fill or development activities within 250 feet of the habitat. However, the 250-foot indirect impact area may be reduced based on Study Area-specific information such as topography or hydrologic data indicating that activities can encroach closer than 250 feet without impacting those habitats or their watersheds. Temporary disturbance and filling of vernal pools would impact vernal pool branchiopods, if present, through removal of individuals and elimination of their habitat.

Protocol-level surveys, consisting of a dry-season and wet-season survey, can be conducted to determine the presence or absence of these species. If the species are absent and USFWS accepts the survey findings, then no mitigation for listed vernal pool branchiopods is likely required. If the species are present, or if the project proponent decides to assume presence without conducting the surveys, then mitigation for listed vernal pool branchiopods would be required.

DRAFT

If mitigation for listed vernal pool branchiopods is required and the project has a federal nexus (e.g., is pursuant to a Corps permit, is federally funded, or occurs on federal land), impacts to listed vernal pool invertebrates can be addressed through Section 7 consultation with the USFWS. If the project does not have a federal nexus, the project proponent, through coordination with USFWS, can prepare a Habitat Conservation Plan under Section 10 of FESA. Typically, the USFWS requires compensatory mitigation for impacts to these species at a 3:1 ratio. Possible mitigation opportunities include creation of habitat within the Study Area or off-site preservation and creation of vernal pools or purchase of vernal pool credits at a qualified mitigation bank. If the SSHCP is approved, the project proponent can also pay the appropriate habitat mitigation fee for impacts to suitable habitat for listed fairy shrimp.

5.5. Swainson's Hawk

Although no Swainson's hawks were observed on the property, the Study Area is considered potential foraging habitat for this species since they are known to nest within five miles of the Study Area and because it is within foraging habitat modeled as modeled by the SSHCP. The nearest recorded nest location is approximately half a mile east of the northeast corner of the Study Area. Currently, the CDFW recommends that impacts to suitable Swainson's hawk foraging habitat within 10 miles of an active nest should be mitigated by securing a conservation easement or fee title on suitable Swainson's hawk foraging habitat in the region. Currently, this translates to the following: (1) for projects within a one-mile radius of an active nest site, the project proponent should preserve 1.0 acre of similar habitat for each acre lost, (2) for projects within a one to five-mile radius of an active nest site, the project proponent should preserve 0.75 acre of similar habitat for each acre lost, and (3) for projects within a five to ten-mile radius of an active nest site, the project proponent should preserve 0.5 acre of similar habitat for each acre lost.

In the case of a conservation easement, the applicant should prepare and implement a Swainson's hawk mitigation plan to the satisfaction of CDFW that includes the preservation of Swainson's hawk foraging habitat on the appropriate amount of foraging acreage. The lead agency under CEQA, in coordination with CDFW, would determine what mitigations would be appropriate for impacts to Swainson's hawk foraging and nesting habitat.

If the SSHCP is approved, the project proponent can also pay the appropriate habitat mitigation fee for impacts to Swainson's hawk foraging habitat or participate in the City of Rancho Cordova habitat mitigation program for Swainson's hawk. The project proponent may also choose to purchase approved offsite mitigation bank credits.

5.6. Burrowing Owl

Although burrowing owls were not observed during previous site visits, the Study Area contains annual grassland that is potentially suitable habitat for burrowing owl and portions of the Study Area are modeled as burrowing owl habitat by the SSHCP. Vegetation clearing activities within the annual grassland could impact potential nest Study Areas for this species. In addition, noise and vibration associated with construction activities in the vicinity of annual grassland could result in nest abandonment.

DRAFT

SSHCP AMM WBO-1 requires an initial burrowing owl survey of the Study area and surrounding 250 feet, where accessible. Transects must be no more than 50 feet apart and all burrows must be mapped.

If the project site does not avoid all suitable habitat mapped by the initial survey, then AMM WBO-2 requires a minimum of two pre-construction survey started no more than 15 days before the onset of construction activities to document the presence or absence of burrowing owls.

If burrowing owls or evidence of burrowing owls are observed within the Study Area or surrounding 250 feet, then AMM WBO-3 requires that 250-foot non-disturbance buffers be established around occupied burrows. If construction activities must take place within these buffer areas then a third-party project proponent must develop an avoidance, minimization, and monitoring plan that is approved by the CDFW. If construction activities take place during the non-breeding season (September 1 through January 31), then the third-party project proponent may request approval from the CDFW for a qualified biologist to excavate unoccupied burrows.

AMM WBO-4 requires the monitoring of the construction buffer zones by an approved biologist and the training of construction personnel by the biologist on avoidance procedures, buffer zones, and protocols in the event that a burrowing owl flies into an active construction zone.

Conditions for approved passive relocation of burrowing owls are specified by AMM WBO-5; conditions for and appropriate methods of rodent control are specified by AMM WBO-7.

5.7. Golden Eagle Foraging Habitat

A known golden eagle nest is located within five miles of the Study Area. Given the territory size of foraging golden eagles, the site could potentially be within the pair's foraging territory. There is not suitable nesting habitat for golden eagles onsite. The annual grassland onsite provides suitable foraging habitat for golden eagle. While the project would result in the removal of approximately 306 acres of suitable foraging habitat, the onsite preserve protects approximately 187 acres of suitable foraging habitat. In addition, mitigation would be required for impacts to Swainson's hawk foraging habitat which would also serve as potential foraging habitat for golden eagle. Therefore, additional measures beyond habitat mitigation has specified for Swainson's hawks and pre-construction nesting bird surveys as specified in **Section 5.8** are not recommended for this species.

5.8. Other Raptors and Migratory Birds

Several species of raptors and other migratory birds may forage and nest in the Study Area, including the special-status species white-tailed kite and loggerhead shrike. Active nests are protected by the California Fish and Game Code Section 3503.5 and the MBTA. Construction activities could result in disturbance of nest Study Areas through temporary increases in ambient noise levels and increased human activity. In addition, vegetation clearing operations, including pruning or removal of trees and shrubs, could impact nesting birds if these activities

DRAFT

occur during the nesting season (February 1 to August 31). All vegetation clearing including removal of trees and shrubs should be completed between September 1 to January 31, if feasible.

Because construction activity will occur in modeled habitat for covered raptor species, AMM RAPTOR-1 requires that a qualified biologist conduct a field investigation to determine if existing or potential nesting sites are present within the project footprint or surrounding 0.25-mile area where accessible.

If potential or existing nest sites are found during the initial surveys and if construction activities will take place during the breeding season (February 1 to August 31), then AMM RAPTOR-2 requires pre-construction surveys to be conducted within 30 days and three days of ground disturbing activity to determine if active nests are present within the project footprint or surrounding 0.25-mile area where accessible.

If active nests are found within the project footprint or surround 0.25-mile area, then AMM RAPTOR-3 requires that a 0.25-mile temporary nest disturbance buffer be created around the active nest until the young have fledged.

If project-related construction activities within the temporary nest disturbance buffer are determined to be necessary, then AMM RAPTOR-4 requires that an approved biologist be retained to monitor the nest daily throughout the nesting season. Work within the temporary nest disturbance buffer can occur with the written permission of the CDFW. If nesting raptors begin to exhibit agitated behavior then the approved biologist will have the authority to shut down construction activities and the biologist, third-party project proponent, and CDFW will meet to determine the best course of action to avoid nest abandonment or take of individuals. Additionally, the approved biologist will train construction personnel on the required avoidance procedures, buffer zones, and protocols in the event that a covered raptor species flies into an active construction zone.

5.9. Pallid Bat

The existing grassland provides suitable foraging habitat and the existing utility shed provide potential roosting habitat for the pallid bat within the Study Area. Removal of man-made structures could impact bats should they be roosting in areas proposed for removal.

A qualified biologist should conduct a preconstruction survey within 14 days prior to clearing or grading operations and removal of any potential roosting site substrates. If no bats are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If special-status bat species are present and roosting on or within 100 feet of the Study Area, then the biologist should establish an appropriate buffer around the roost site. At minimum, no potential roosting structures should be removed until the biologist has determined that no bats

DRAFT

are roosting in the structure. Additional mitigation measures for bat species, such as installation of bat boxes or alternate roost structures, would be recommended only if special-status bat species are found to be roosting within the project area. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for various bat species.

5.10. Sensitive Habitats

Table 2 summarizes the sensitive habitats and expected impacts from the proposed project. Proposed Project impacts to sensitive habitats are shown in **Figure 4**.

TABLE 2 — IMPACTS TO SENSITIVE HABITATS

Sensitive Habitats	Impacted Acreage	Preserved Acreage	Total Acreage†
Depressional Seasonal Wetland	1.04	1.85	2.89
Vernal Pool	4.75	9.97	14.72
Riverine Seasonal Wetland	0.51	1.15	1.66
Intermittent Drainage	0.01 (temporary)	1.53	1.54
Seasonal Wet Swale	0.06	—	0.06
Total	**6.58**	**14.5**	**20.87**

†Total acreages do not account for buffer areas or non-sensitive habitats.

5.10.1. Jurisdictional Waters

Proposed construction activities will impact approximately 6.58 acres of aquatic features located in the Study Area (**Figure 4**).

A Section 404 permit should be obtained from the Corps and a Section 401 Water Quality Certification should be obtained for the Regional Water Quality Control Board (RWQCB) prior to the start of construction that will impact any water of the U.S, and water of the state. Any waters of the U.S. or jurisdictional wetlands that would be lost or disturbed should be replaced or rehabilitated on a “no-net-loss” basis in accordance with the Corps mitigation guidelines. Habitat restoration, rehabilitation, and/or replacement should be at a location and by methods agreeable to the agencies. A Lake and Streambed Alteration Notification (SAA) should also be prepared and submitted to CDFW for impacts to features under CDFW jurisdiction.

Water quality concerns during construction would be addressed in a Section 401 water quality certification from the Regional Water Quality Control Board. A Storm Water Pollution Prevention Plan (SWPPP) would also be required during construction activities. SWPPPs are

DRAFT

required in issuance of a National Pollutant Discharge Elimination System (NPDES) construction discharge permit by the U.S. Environmental Protection Agency. Implementation of Best Management Practices (BMPs) during construction is standard in most SWPPPs and water quality certifications. Examples of BMPs include stockpiling of debris away from regulated wetlands and waterways; immediate removal of debris piles from the Study Area during the rainy season; use of silt fencing and construction fencing around regulated waterways; and use of drip pans under work vehicles and containment of fuel waste throughout the Study Area during construction.

A Lake and Streambed Alteration Agreement from CDFW may also be required for impacts to wetlands and other waters. A Streambed Notification should be submitted to CDFW for review to determine if a streambed agreement is necessary.

5.11. Summary of Avoidance and Minimization Measures

- Obtain a 404 permit, 401 Water Quality Certification, and SAA prior to the start of construction;
- Conduct pre-construction surveys for Ahart's dwarf rush, dwarf downingia, pincushion navarretia, and hoary navarretia in May;
- Conduct pre-construction burrowing owl protocol surveys between February and June.
- Assume presence of listed vernal pool branchiopods and mitigate according to SSHCP unless project proponent wants to conduct focused surveys;
- Conduct pre-construction surveys for western spadefoot, American badger, western pond turtle, pallid bat, and nesting birds prior to the start of construction as applicable and
- Conduct worker awareness training at the start of construction for potentially occurring special-status species.

IX NATURAL RESOURCES ELEMENT

VISION STATEMENT

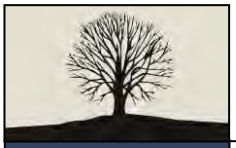
Rancho Cordova will achieve a balance of natural resources and urban form through the compatible preservation of natural resources within the man-made environment. Natural resources will be protected, conserved, and reflected in the built environment. Creek corridors, preserves, trees, and open space areas will enhance neighborhoods and public spaces. The community's water resources will be conserved and protected from contamination. All new development will be consistent with stormwater regulations and protect against erosion. The community will strive to conserve energy and to recycle construction materials, green waste, and consumer goods.

INTRODUCTION

Natural resources connect with urban life in many ways, providing an important relationship between humans and the natural environment; including biological resources, and water resources. Ensuring quality management and protection of the City's numerous natural resources will contribute to Rancho Cordova's environmental health as well as to quality of life for residents. The City will become a leader in natural resource conservation, managing natural resources to ensure long-term sustainability while evaluating new opportunities and techniques in conservation.

PURPOSE

The Natural Resources Element identifies the ways in which Rancho Cordova will protect, maintain, and enhance its natural resources for the betterment of current residents and future generations. In combination, the Natural Resources Element and the Open Space, Parks and Trails Element represent the conservation element of the General Plan. The Open Space, Parks and Trails Element contains details on the City's Open Space Plan. It also attempts to balance the present needs of resource users with the need for resource conservation for the common good. The goals, policies, and actions in this Element will foster the preservation of Rancho Cordova's many valuable natural resources, including wildlife, habitat, water resources, soils, and mineral resources.



RELATED PLANS AND PROGRAMS

The Natural Resources Element relates to several other federal, State and local plans and programs, including the following:

- **National Environmental Policy Act.** The National Environmental Policy Act (NEPA) is a federal environmental review process for projects that have a federal nexus (e.g., impact federal resources or lands, receive federal funding, or require federal approval or permits). NEPA requires federal agencies to integrate environmental values into their decision-making processes by considering the environmental impacts of their proposed actions and reasonable alternatives to those actions. This Element is consistent with the intent of NEPA. It contains a goal and supporting policies and actions related to protecting and preserving diverse wildlife and plant habitat.

- **Federal Endangered Species Act.** The Federal Endangered Species Act (FESA) is a federal law that protects species that are endangered or threatened with extinction. FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined as harassing, harming (including significantly modifying or degrading habitat), pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (16 USC 1532, 50 CFR 17.3). Actions in this Element require the City to coordinate with federal agencies on wetland preserves and creek corridors.

- **Vernal Pool Recovery Plan.** The U.S. Fish & Wildlife Service's Vernal Pool Recovery Plan (Recovery Plan) covers 33 plant and animal species that occur exclusively or primarily within the California and southern Oregon vernal pool ecosystem. As drafted, the Recovery Plan identifies a five-part strategy to ameliorate or eliminate threats to affected species and to preserve intact vernal pools. This Element contains a goal, policies and actions related to preserving wetlands.

- **Section 404 of the Clean Water Act (404 Permits).** Section 404 of the Clean Water Act regulates the discharge of dredged or fill material into waters of the United States (waters of the U.S.), including wetlands and vernal pools. Activities in waters of the U.S. that are regulated under this program include fill for development, water resource projects (such as dams and levees), infrastructure development (such as highways and airports) and mining projects. This Element contains a goal, policies and actions related to preserving and mitigating for the loss of wetlands.

- **Section 401 of the Clean Water Act (Water Quality Certification).** Section 401 of the Clean Water Act requires a State Water Quality Certification for all federal permit or license applications for any activity that may result in a discharge to a water body to ensure compliance with state water quality standards. Most Certifications are issued in connection with section 404 permits for dredge and fill discharges. The Central Valley Regional Water Quality Board issues Section 401 water quality certifications for projects in Rancho Cordova. This Element contains a goal with supporting policies and actions related to creeks and a goal with supporting policies and actions related to water quality.

- **Section 402 of the Clean Water Act (NPDES Permits).** Section 402 of the Clean Water Act establishes permit programs to authorize discharge of storm water from municipal storm sewer systems. Rancho Cordova has a Municipal Stormwater Permit under the National Pollutant Discharge Elimination System (NPDES) Permit Program with Sacramento County, Elk Grove, Galt and the City of Sacramento. The Regional Water Quality Control Board, Central Valley Region, issues and administers the Sacramento NPDES municipal stormwater permit. This Element contains a policy and supporting actions related to urban runoff and discharging materials into creeks.

- **California Environmental Quality Act.** The California Environmental Quality Act (CEQA) is the State's environmental review process that requires public agencies to identify the significant environmental effects of a project and either avoid the significant environmental effects, where feasible, or mitigate the significant environmental effects, where feasible. This Element contains an action that specifically requires CEQA analysis of projects.

- **California Endangered Species Act.** The California Endangered Species Act is the State's listing of endangered and threatened species. It requires state agencies to consult with the California Department of Fish and Game (CDFG) when preparing CEQA documents to ensure that the state lead agency actions do not jeopardize the existence of listed species. This Element contains a goal and supporting policies and actions related to protecting and preserving diverse wildlife and plant habitat, and an action requiring coordination with CDFG on Swainson's hawk mitigation.

- **California Fish and Game Code.** The California Fish and Game Code contains laws and regulations relating to California's fish, wildlife, plants, and their habitats. The Code is administered by the California Department of Fish and Game. This Element contains a goal and supporting policies and actions related to protecting and

preserving diverse wildlife and plant habitat, and an action requiring coordination with CDFG on Swainson's hawk mitigation.

- **Surface Mining and Reclamation Act.** The Surface Mining and Reclamation Act (SMARA) addresses the need for a continuing supply of mineral resources and to prevent or minimize the negative impacts of surface mining to public health, property and the environment. SMARA's requirements apply to all surface mining operations in California that disturb more than one acre or remove more than 1,000 cubic yards of material including, but is not limited to, prospecting and exploratory activities, dredging and quarrying, streambed skimming, borrow pitting, and the stockpiling of mined materials. This Element contains a goal and supporting policies and actions related to environmentally sensitive extraction of minerals and reclamation.

- **California Integrated Waste Management Act.** The California Integrated Waste Management Act (CIWMA) requires each city and county to prepare, adopt, and submit to the California Integrated Waste Management Board a source reduction and recycling element (SRRE) that demonstrates how the jurisdiction will meet the IWMA's mandated diversion goals. This Element contains a goal and supporting policies and actions related to waste reduction, reuse, recycling and composting.

- **California Public Resources Code, Sections 41500-41510.** The Public Resources Code (PRC) requires each city and county to prepare, adopt and submit to the Waste Management Board a program for the safe collection, recycling, treatment, and disposal of hazardous wastes that are generated by households. This Element contains a goal and supporting policies and actions related to recycling and a goal and supporting policies and actions related to recycling of hazardous materials.

- **South Sacramento Habitat Conservation Plan (SSHCP).** The South Sacramento Habitat Conservation Plan (SSHCP) is a mitigation plan being prepared and managed by Sacramento County that seeks strategies that allow commercial, residential, and other development, while balancing the needs of sensitive plant and animal species. The SSHCP covers land within Sacramento County, including portions of the cities of Rancho Cordova, Elk Grove and Galt. The SSHCP is intended to consolidate environmental efforts to protect and enhance wetlands (primarily vernal pools) and upland habitats to provide ecologically viable conservation areas. The SSHCP will also minimize regulatory hurdles and streamline the development permit process for projects that are covered by and consistent with the plan. This Element contains a goal with supporting policies and actions related to protecting and preserving diverse wildlife and plant habitat, a policy about participation in an HCP, and a goal with supporting policies and actions related to preserving natural wetlands.

- **American River Parkway Plan.** The American River Parkway Plan was adopted by the City of Sacramento, Sacramento County and the State Legislature to manage the

Parkway's natural resources and promote recreation in a natural environment with minimal impacts. Sacramento County is currently updating the American River Parkway Plan. The ARPP Update is required because the context and usage of the three areas has changed considerably since the Plan was adopted. The City of Rancho Cordova is participating in the ARPP Update. This regional resource/amenity passes through the northern portion of Rancho Cordova. This Element contains a goal with supporting policies and actions related to protecting and preserving diverse wildlife and plant habitat.

RELATIONSHIP TO OTHER GENERAL PLAN ELEMENTS

The Natural Resources Element is closely related to the Open Space, Parks, and Trails Element and Air Quality Element of the General Plan. The Open Space, Parks and Trails Element contains goals, policies and actions that establish the open space plan for the City. Together, the two elements represent the conservation element of the General Plan. The Air Quality Element contains policies about maximizing air quality benefits through the use of landscaping and trees, which are directly related to policies in the Natural Resources Element. Where appropriate, cross-references are provided to alert the reader to information in the other elements.

ISSUES AND CONSIDERATIONS

NATURAL RESOURCES SETTING

The Planning Area contains many varied natural resources, from habitats to creeks to water supplies. Each resource has an important function within the City and the region. The City does not contain forests, harbors, or fisheries. Therefore, the Natural Resources Element does not contain goals, policies or actions related to such resources.

IX NATURAL RESOURCES ELEMENT

Plant and Animal Habitat

A variety of unique and valuable habitats are found within the Planning Area, including, but not limited to, oak and cottonwood woodlands, various grasslands, vernal pool areas, and open water and rivers. The habitats of the Planning Area contain numerous special status plant and animal species. A comprehensive list of the habitats and species in the Planning Area is provided in the Background Report that accompanies the General Plan.

Table NR-1 at the end of this Element includes a current list of special-status species that occur within the Rancho Cordova Planning Area.

Wetlands and Creeks

Wetlands and creeks in the Planning Area provide a variety of functions to the community. Creeks provide important ecosystem functions. The riparian habitat associated with creeks supports diverse and abundant plant and animal life and provides movement corridors for animals. Wetlands in the project area also have important ecological functions in that they support unique assemblages of specially adapted biota. In addition to their ecological functions, wetlands and creeks provide important water filtration and treatment, water supply, water storage, and recreational functions.

Water Resources

The Planning Area contains several surface water and groundwater resources. Major surface water resources include the American River, the Cosumnes River, Morrison Creek, Laguna Creek, Elder Creek, Buffalo Creek, Blodgett Reservoir, and the Folsom South Canal. Groundwater is found in aquifer zones underneath the Planning Area.

Former Aerojet and Boeing operations associated with rocket testing resulted in groundwater contamination in portions of the Planning Area. The groundwater contamination spread in a plume that extends south and west within Rancho Cordova, as well as north under the American River into Carmichael. The Environmental Protection Agency (EPA) designated the Aerojet property as a Superfund site. A site is only designated as a Superfund site if it has been contaminated by hazardous waste and if the Environmental Protection Agency (EPA) has identified the site as a candidate for cleanup because it poses a risk to human health and/or the environment. In 2000, the EPA proposed a plan to clean up the plume of groundwater contamination to the west of the Aerojet property and to ensure continued, safe water supplies for area residents. Aerojet has

installed wells, pipelines, and treatment systems in the first phase of their effort to remove the groundwater contamination. Cleaning of the contamination officially began in 1979.

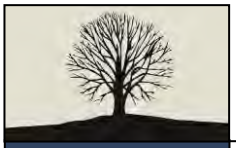
The current groundwater remediation is anticipated to be a long-term commitment, possibly operating more than 100 years. A significant volume of extracted and treated groundwater, possibly exceeding 30,000 acre-feet per year, is expected to be discharged to the American River. After flowing downstream to the Sacramento River and south to the Freeport pumping station, the water will be introduced into the County's municipal water system. The use of this water has been established through legal agreements between Aerojet, Sacramento County, and affected local water agencies.

Water is provided to the Rancho Cordova's Planning Area by three water purveyors including Sacramento County Water Agency (SCWA) Zone 40, Golden State Water Company (GSWC), and California-American Water Company (Cal-Am). The City's water supply is currently provided by a combination of ground and surface water resources. Future water supplies will be provided from a variety of sources, including: water from the Central Valley Project; appropriate water supplies; water transfer supplies; groundwater; recycled water; surface water from the American River; SMUD transfer water; and Aerojet replacement water.

A Water Supply Evaluation was prepared for the General Plan to identify water supply needs of the proposed General Plan under buildout of proposed land uses in the City's current boundaries as well as the Planning Area outside of the City under the State law providing for coordination between cities and counties and water planning activities of water purveyors and agencies. This work involved consultation with the current public and private water purveyors in the Planning Area, as well as requests for formal consultation regarding water supply availability by the City. Urban Water Management Plans (UWMP) for all water purveyors were obtained and used in the Water Supply Evaluation. The UWMPs identified the purveyor's existing and projected future water supplies and projected water demands through 2030 within each of their service areas.

Soils/Aggregate Resources

The soils in the Planning Area are largely expansive clay soils, which tend to present challenges for construction. The Planning Area also contains approximately 10,275 acres of mine tailings, which are comprised of high-quality aggregate resources and possibly mineral resources such as gold. There are several existing mining operations within the Planning Area, some of which may expand in the future. These operations will play an important role in supplying materials for the build-out of the community.



IX NATURAL RESOURCES ELEMENT

ISSUES THIS ELEMENT ATTEMPTS TO SOLVE

The goals, policies, and actions in this Element attempt to solve the following issues, raised during discussion of natural resource conservation:

- Protecting wildlife and wetlands areas.

- Encouraging the City and various public agencies to work together to establish natural resource protection areas both inside and outside of the City.

- Ensuring compatibility and mutual benefit, to the maximum extent feasible, between mitigation preserves and urban development.

- Reducing the impacts of new development on the use of water and mineral resources.

- Ensuring the availability of aggregate resources to support construction within the City.

- Maintaining continuous and uninterrupted connections between mitigation preserves providing habitat corridors that allow species migration and minimize habitat and species isolation.

- Reducing solid waste production and promoting recycling activities that seek to reduce the amount of solid waste to state-mandated levels.

GOALS, POLICIES, AND ACTIONS

The goals of this element are as follows and are listed subsequently with corresponding policies and actions. The term "feasible" as used in the Natural Resources Element of the City General Plan shall be defined as follows: "Feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social and technological factors.

- **Goal NR1: Protect and preserve diverse wildlife and plant habitats, including habitat for special status species.**

- **Goal NR.2: Preserve the City's rich and diverse natural wetlands.**

- **Goal NR.3: Preserve and maintain creek corridors and wetland preserves with useable buffer zones throughout the new development areas as feasible.)**

- **Goal NR.4: Encourage the planting and preservation of high-quality trees throughout the City.**
- **Goal NR.5: Protect the quantity and quality of the City's water resources.**
- **Goal NR.6: Support the environmentally sensitive extraction of minerals and the subsequent reclamation of mined areas.**
- **Goal NR.7: Reduce per capita energy consumption.**
- **Goal NR.8: Promote waste reduction, reuse, recycling, and composting efforts.**

GOAL NR.1 - PROTECT AND PRESERVE DIVERSE WILDLIFE AND PLANT HABITATS, INCLUDING HABITAT FOR SPECIAL STATUS SPECIES.

Policy NR.1.1 - Protect rare, threatened, and endangered species and their habitats in accordance with State and federal law.

- **Action NR.1.1.1** - Incorporate habitat preserves and interconnected wildlife corridors in new development areas to allow for animal movement where feasible and as necessary for viability of protected species.
- **Action NR.1.1.2** – Review projects through the entitlement process and CEQA analysis to ensure that they comply with this policy if the site contains unique habitat, creeks, and/or wooded corridors.
- **Action NR.1.1.3** - As part of the consideration of development applications for individual Planning Areas containing habitats that support special-status plant and animal species that are planned to be preserved, the City may require that these preserved habitats have interconnections with other habitat areas where feasible and appropriate to promote the viability of the preserved habitat to support the special-status species identified. The determination of the design and size of the "interconnections" shall be made by the City, with the consideration of a recommendation from a qualified professional, after California Department of Fish and Game and U.S. Fish and Wildlife Service are provided with an opportunity to comment.

Cross reference: LU.3.4

- **Action NR.1.1.4** - Prior to the approval of any public or private development project in areas containing trees, the City shall require that a determinate survey be conducted during the nesting season (March 1 and August 31) to identify if active nesting by birds protected under the Migratory Bird Treaty Act (MBTA) is taking place. If all site disturbance is to occur outside this time, the actions described in this mitigation measure are not required. If nesting activity is observed, consultation with the City of Rancho Cordova Planning Department shall be conducted in order to determine the appropriate mitigation, if any, required to minimize impacts to nesting birds. No activity may occur within 100 feet of any nesting activity or as otherwise required following consultation with the California Department of Fish and Game.

Policy NR.1.2 - Conserve Swainson's hawk habitat consistent with State policies and Department of Fish and Game guidelines.

- **Action NR.1.2.1** – Establish a Swainson's Hawk Ordinance in coordination with the California Department of Fish and Game to establish the process of mitigating for the loss of Swainson's hawk foraging habitat based on habitat value lost to development. The ordinance will set forth a process where habitat lost to development will be mitigated through the permanent protection of equivalent or better existing habitat conditions (referred to hereafter as "mitigation lands"). The specific required mitigation ratios (habitat acreage lost versus mitigation lands) and any other provisions to mitigation process shall be established through technical studies as part of the development of the ordinance and will take into account value of habitat to be converted in relation to habitat value of the mitigation lands (e.g., relation to nesting sites), proximity of the mitigation lands to adjacent conditions affecting habitat (e.g., nearby land uses and already permanently protected lands), and other relevant factors. The ordinance will also establish standards ensuring that mitigation land will be adequately protected and managed in perpetuity (e.g., via conservation easement, deed restriction or other appropriate method), and setting forth the timing of the required provision of mitigation lands in relation with the timing of the loss of habitat in the City (as its boundaries may be changed through subsequent annexations), such that mitigation lands shall be provided no later than prior to ground disturbance.

Policy NR.1.3 – Promote educational programs that inform the public about natural resources.

- **Action NR.1.3.1** – Coordinate with non-profit groups, educational institutions, and other agencies to provide environmental education programs that inform the public about the City's natural resources, existing preserve sites, and cohabitation with common urban wildlife populations.

Policy NR.1.4 - Discourage the planting of invasive species.

- **Action NR.1.4.1** - Create an educational leaflet that identifies common invasive species and recommends the planting of non-invasive species.

- **Action NR.1.4.2** - The City shall adopt and maintain a Noxious Weed Ordinance. The Noxious Weed Ordinance shall include regulatory standards for construction activities that occur adjacent to natural areas to inhibit the establishment of noxious weeds through accidental seed import.

Policy NR.1.5 - Ensure the protection of wildlife through the establishment of programs to control feral pet populations.

Policy NR.1.6 – Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.

Policy NR.1.7 – Prior to project approval, the City shall require a biological resources evaluation for private and public development projects in areas identified to contain or possibly contain listed plant and/or wildlife species based upon the City's biological resource mapping provided in the General Plan EIR or other technical materials.

- **Action NR.1.7.1** - For those areas in which special status species are found or likely to occur, the City shall require feasible mitigation of impacts to those species that ensure that the project does not contribute to the decline of the affected species such that their decline would impact the viability of the species. Feasible mitigation shall be determined by the City after the U.S. Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG) are provided an opportunity to comment, and may emphasize a multi-species approach. This may include development or participation in a habitat conservation plan.

Policy NR.1.8 - The City shall encourage creation of habitat preserves that are immediately adjacent to each other in order to provide interconnected open space areas for animal movement.

Policy NR.1.9 - The City shall require that impacts to riparian habitats be mitigated at a no net loss of existing function and value based on field survey and analysis of the riparian habitat to be impacted. No net loss may be accomplished by avoidance of the habitat, restoration of existing habitat, or creation of new habitat, or through some combination of the above.

Policy NR.1.10 - The placement of new roadways within habitat preserves shall be discouraged, but is not prohibited. This Policy shall not apply to roadways shown in the Circulation Element or needed to meet goals or policies of the Circulation Element.

Policy NR.1.11 - In such cases where a new roadway crosses a habitat preserve or separates two adjacent preserves, the roadway shall include design features, where feasible and appropriate, to allow for the movement of wildlife across or beneath the road without causing a hazard for vehicles, bicycles and pedestrians on the roadway.

GOAL NR.2 - PRESERVE THE CITY'S RICH AND DIVERSE NATURAL WETLANDS.

Policy NR.2.1 – Require mitigation that provides for "no net loss" of wetlands consistent with current State and federal policies.

- **Action NR.2.1.1** - During the environmental review process, evaluate feasible on-site alternatives that will reduce impacts to wetland resources and effectively preserve these resources.

Policy NR.2.2 - Ensure that direct and indirect effects to wetland habitats are mitigated to the extent feasible by environmentally sensitive project siting and design or other measures.

Policy NR.2.3 – Work with private and non-profit conservation organizations to ensure competitive pricing for mitigation bank credits by allowing government agencies, non-profit organizations, and private landowners to establish vernal pool preserves, designate mitigation areas, create and restore vernal pools, and sell credits to developers for off-site mitigation.

Policy NR.2.4 - Educate the public on the importance and benefit of wetlands areas.

- **Action NR.2.4.1** - Develop trails and associated educational facilities (e.g., information kiosks, signage) around wetland and vernal pool preserves where possible while maintaining the integrity of sensitive natural resources.

- **Action NR.2.4.2** – Consider constructing low impact trails interior to preserves, such as elevated board walkways, in coordination with the U.S. Fish and Wildlife Service and U.S. Army Corps of Engineers.

Policy NR.2.5 - The City shall require that drainage improvements that discharge into areas of wetlands to be preserved are, to the maximum extent feasible, designed to mimic the undeveloped surface water flow conditions of the area in terms of seasonality, volume, and flow velocity.

GOAL NR.3 - PRESERVE AND MAINTAIN CREEK CORRIDORS AND WETLAND PRESERVES WITH USEABLE BUFFER ZONES THROUGHOUT THE NEW DEVELOPMENT AREAS AS FEASIBLE.

Policy NR.3.1 - Coordinate with property owners and local interest groups, such as the Sacramento Urban Creeks Council, to restore, enhance, and preserve creeks in Rancho Cordova.

Policy NR.3.2 - In general, the City will encourage the preservation of existing location, topography, and meandering alignment of natural creeks. The modification, re-creation and realignment of creek corridors shall recreate the character of the natural creek corridor to the extent feasible, appropriate and consistent with other City policies. Channelization and the use of concrete within creek corridors shall be discouraged, but is not prohibited.

- **Action NR.3.2.1** – Develop guidelines for channel creation or modification that will ensure channel meander, naturalized side slope, and varied channel bottom elevation are considered in design.

- **Action NR.3.2.2** – Adopt and implement improvement standards for soft bottom channels.

Policy NR.3.3 – Encourage the creation of secondary flood control channels where the existing channel supports extensive riparian vegetation.

- **Action NR 3.3.1 –** Work with affected local, state, and federal agencies, including SACOG, the California Department of Water Resources, Delta Keepers, and the U.S. Army Corps of Engineers, to determine when natural creek corridors can and should accommodate storm flows or if separate storm water conveyance structures are necessary.

Cross reference: OSPT 2.3

Policy NR.3.4 – Encourage projects that contain wetland preserves or creeks, or are located adjacent to wetland preserves or creeks, to be designed for visibility and, as appropriate, access.

- **Action NR.3.4.1** - Establish performance standards for natural resource preserves that accomplish the following:

  – Provide sufficient width for a mowed firebreak (where necessary), adjacent passive recreation uses, and access for channel maintenance and flood control.

– Offer sufficient width in and/or adjacent to preserves to allow for existing and created wildlife habitat, species sensitive to human disturbance, vegetative filtration for water quality, corridor for wildlife habitat linkage, protection from runoff, and other impacts of urban uses adjacent to the corridor.

– Allow for sufficient width adjacent to natural resource preserves to allow for trails and greenbelts.

– Prohibit the placement of water quality treatment structures designed to meet pollutant discharge requirements within mitigation preserves.

- **Action NR.3.4.2** – Establish standards that allow public access in the floodplain and buffers along creek corridors and preserves. Mitigation measures shall be incorporated into environmental documents and conditions of approval that require open-view fencing adjacent to preserves.

- **Action NR.3.4.3 –** Establish standards and/or guidelines for development adjoining wetland preserves or creeks to maximize visibility by designing the land plan with public streets on at least one side of the corridor or preserve with vertical curbs, gutters, footpath(s), street lighting, and post and cable barriers to prevent unauthorized vehicular entry into creek corridors and preserves.

GOAL NR.4 – ENCOURAGE THE PLANTING AND PRESERVATION OF HIGH-QUALITY TREES THROUGHOUT THE CITY.

Policy NR.4.1 - Conserve native oak and landmark tree resources for their historic, economic, aesthetic, educational, and environmental value.

- **Action NR.4.1.1 -** Implement the City's Tree Preservation and Protection Ordinance (and update as necessary) to establish minimum requirements for preserving native trees and landmark trees in the City, including a definition of the size, species, and age requirements of landmark, oak, and other trees to be protected and/or replaced.

- **Action NR.4.1.2** - Where feasible, require underground utility lines that are in close proximity to oaks and other landmark trees to be designed and installed to minimize impacts to trees. Work with the utility provider(s) to coordinate transmission line location and other potential impacts associated with the undergrounding of the utilities.

- **Action NR.4.1.3** - Establish development guidelines that require all oak habitat to be avoided to the maximum extent feasible. When avoidance is not possible, require mitigation efforts that result in preservation of in-kind habitat in the Planning Area.

Policy NR.4.2 - Improve overall landscaping quality and sustainability in all areas visible to the public.

- **Action NR.4.2.1** - Create development guidelines to establish minimum planting standards and require appropriate tree species and planting densities within newly landscaped areas that are visible to or shared by the public. An adopted Tree List should be used as a guideline for all tree plantings within the City.

Cross reference: UD.2.6.2

- **Action NR.4.2.2** - Create development guidelines that address landscaping standards and that require appropriate tree species and densities in buffer areas. The guidelines should also ensure that medians will include native plantings and trees, and will be wide enough to support the long-term viability of the plantings.

Cross reference: UD.2.6.2

- **Action NR.4.2.3** - Provide leaflets and planting guides that promote the use of drought-tolerant native vegetation in home landscaping.

- **Action NR.4.2.4** – Discourage the use of invasive non-native species.

- **Action NR.4.2.5** – Establish a mistletoe abatement and remediation program.

- **Action NR.4.2.6** - Establish guidelines to require planting of trees to reduce "heat island" effects, in order to reduce the need for air conditioning and thus conserve energy.

Policy NR.4.3 - Promote trees as economic and environmental resources for the use, education, and enjoyment of current and future generations.

- **Action NR.4.3.1** - Achieve "Tree City USA" status. This will require the City to continue to implement the City's Tree Preservation and Protection Ordinance (and update as necessary), appoint a board, department or commission to advise the city on tree issues, spend two dollars per capita on community forestry activities, and hold an Arbor Day celebration.

Cross reference: AQ.2.4

- **Action NR.4.3.2** - Designate local funds to educate the public on tree planting and preservation.

- **Action NR.4.3.3** - Coordinate with SMUD to offer programs or other resources to provide property owners with information on proper tree selection, proper location to reduce heat transfer effects, planting and maintenance.

- **Action NR.4.3.4** – Actively participate in the Sacramento Tree Foundation Greenprint Program.

Policy NR.4.4 - Prior to the approval of any public or private development project in areas identified or assumed to contain trees, the City shall require that a determinate survey of trees species and size be performed. If any native oaks or other native trees six inches or more in diameter at breast height (dbh), multitrunk native oaks or native trees of 10 inches or greater dbh, or non-native trees of 18 inches or greater dbh that have been determined by a certified arborist to be in good health are found to occur, such trees shall be avoided if feasible. If such trees cannot be avoided, the project applicant shall do one of the following:

- All such trees shall be replaced at an inch-for-inch ratio. A replacement tree planting plan shall be prepared by a certified arborist or licensed landscape architect and shall be submitted to the City of Rancho Cordova for approval prior to removal of trees; or,

- The project applicant shall submit a mitigation plan that provides for complete mitigation of the removal of such trees in coordination with the City of Rancho Cordova. The mitigation plan shall be subject to the approval of the City.

- If the City of Ranch Cordova adopts a tree preservation ordinance at any time in the future, any future development activities shall be subject to that ordinance instead.

GOAL NR.5 - PROTECT THE QUANTITY AND QUALITY OF THE CITY'S WATER RESOURCES.

Policy NR.5.1 - Promote water conservation within existing and future urban uses.

- **Action NR.5.1.1** - Install water-conserving landscaping and irrigation on City-owned and operated facilities.

- **Action NR.5.1.2** - Require development project approvals to include a finding that all feasible and cost-effective options for conservation and water reuse are incorporated into project design.

- **Action NR.5.1.3** - Establish a program that requires per capita water consumption to be reduced by at least 20 percent by 2030 from 2006 baseline conditions consistent with State law. The program shall include the following measures:

- Restrict water usage through metering or establishing designated watering days for the City's residences and businesses.

- Promote water conservation efforts through education.

- Implement standards that require low-flow appliances and fixtures in all new development.

- Work with water providers and water conservation agencies to create an incentive program that encourages retrofitting existing development with low-flow water fixtures.

- Require new development and landscaped public areas to utilize state-of-the-art irrigation systems that reduce water consumption (e.g., gray-water systems).

- Encourage drought-tolerant and native vegetation.

- **Action NR.5.1.4** – Require water purveyors to include a provision for water supply monitoring and reporting in the franchise agreements.

Policy NR.5.2 - Encourage the use of treated wastewater to irrigate parks, golf courses, and landscaping.

- **Action NR.5.2.1** – Establish a Large-Scale Recycled Water Program and Citywide Recycled Water Distribution System Ordinance.

- **Action NR.5.2.2** – Coordinate with the City's water purveyors and the SRCSD to establish a connected "purple pipe" system throughout the City's new development areas that uses recycled water.

Policy NR.5.3 - Protect surface and ground water from major sources of pollution, including hazardous materials contamination and urban runoff.

- **Action NR.5.3.1** - Restrict hazardous materials storage in the 100-year and 200-year floodplain to prevent surface water contamination.

Cross reference: S.5.3

Cross reference: S.5.1

- **Action NR.5.3.2** - Educate the community on laws governing the proper handling of hazardous materials, especially those laws which pertain to discharging materials into creeks.

- **Action NR.5.3.3** - Install appropriate signage to deter the discharge of hazardous materials into storm drains.

- **Action NR.5.3.4** - Future land uses that are anticipated to utilize hazardous materials or waste shall be required to provide adequate containment facilities to ensure that surface water and groundwater resources are protected from accidental releases. This shall include double-containment, levees to contain spills, and monitoring wells for underground storage tanks, as required by local, state, and federal standards. Future land uses that include on-site storage of hazardous materials and waste comply with all applicable local, state and federal regulations, including those regulating the use, storage, handling and disposal of hazardous materials.

Policy NR.5.4 - Prevent contamination of the groundwater table and surface water, and remedy existing contamination to the extent practicable.

- **Action NR.5.4.1** – Provide information on pollution prevention, disposal of hazardous waste and chemicals, liability and clean-up on the City's website and in educational materials and brochures.

- **Action NR.5.4.2** - Require clean-up of contaminated ground and surface water by current and/or past owners or polluters.

- **Action NR.5.4.3** - Encourage pollutant cleansing companies to use the latest technologies available in order to expedite the cleansing process and do the least harm to the environment.

Policy NR.5.5 – Minimize erosion to stream channels resulting from new development in urban areas consistent with State law.

Cross reference: 5.2.3.1

- **Action NR.5.5.1** - Require development projects to contain urban runoff control strategies and requirements that are consistent with Master Drainage Plans and the City's urban runoff management program.

- **Action NR.5.5.2** - Require development within newly urbanizing areas to incorporate runoff control measures into their site design or to participate in an area-wide

runoff control management effort consistent with standards developed by the Public Works Department.

- **Action NR.5.5.3** - Encourage new development to incorporate features such as grassy swales, multi-use retention or detention basins, and integrated drainage systems to enhance water quality. Work with the Cordova Recreation and Park District to establish standards for integrating retention/detention basins into park sites and create examples of desirable and innovative natural drainage features.

- **Action NR.5.5.4** - Require the use of best management practices to protect receiving waters from the adverse effects of construction activities, sediment and urban runoff consistent with current state law.

Policy NR.5.6 - Incorporate Storm Water, Urban Runoff, and Wetland Mosquito Management Guidelines and Best Management Practices into the design of water retention structures, drainage ditches, swales, and the construction of mitigated wetlands in order to reduce the potential for mosquito-borne disease transmission.

Policy NR.5.7 - Continue to cooperate and participate with the County, other cities, and the Regional Water Quality Control Board regarding compliance with the joint National Pollutant Discharge Elimination System Permit (NPDES No. CAS082597) or any subsequent permit and support water quality improvement projects in order to maintain compliance with regional, state and federal water quality requirements.

Policy NR.5.8 - The City shall require groundwater impact evaluations be conducted for the Grant Line West, Westborough, Aerojet, Glenborough, Mather and Jackson Planning Areas to determine whether urbanization of these areas would adversely impact groundwater remediation activities associated with Mather and Aerojet prior to the approval of large-scale development. Should an adverse impact be determined, a mitigation program shall be developed in consultation with applicable local, state, and federal agencies to ensure remediation activities are not impacted. This may include the provision of land areas for groundwater remediation facilities, installation/extension of necessary infrastructure, or other appropriate measures.

GOAL NR.6 - SUPPORT THE ENVIRONMENTALLY SENSITIVE EXTRACTION OF MINERALS AND THE SUBSEQUENT RECLAMATION OF MINED AREAS.

Policy NR.6.1 – Ensure that the environmental effects of mining and reclamation on aquifers, streams, scenic views, and surrounding residential uses are prevented or minimized.

- **Action NR.6.1.1** – Regulate surface mining operations as required by California's Surface Mining and Reclamation Act of 1975 ("SMARA"), Public Resources Code Section 2207 (relating to annual reporting requirements), and State Mining and Geology Board regulations for surface mining and reclamation practice.

- **Action NR.6.1.2** – Coordinate mining operations and urban development to minimize conflicts between residents and mining, particularly where mining is required before urbanization.

- **Action NR.6.1.3** – Require inactive mined lands to be reclaimed to a usable condition that is readily adaptable to the future, anticipated land uses.

Policy NR.6.2 – Eliminate residual hazards to the public health and safety.

- **Action NR.6.2.1** – Establish and require minimum setbacks of future and reauthorized surface mining from adjoining residential land uses.

- **Action NR.6.2.2** - Prohibit the use of cyanide-leaching systems for gold extraction.

Policy NR.6.3 - While mining activities are anticipated to be phased out within the City, the City recognizes the right of these uses to continue and will require setbacks, buffers, screening, and other appropriate measures to allow for the continued operation of mining activities.

GOAL NR.7 - REDUCE PER CAPITA ENERGY CONSUMPTION.

Cross reference: H.6.1

Policy NR.7.1 - Increase energy conservation Citywide.

- **Action NR.7.1.1** - Develop educational programs to increase energy conservation at the household and business levels.

- **Action NR.7.1.2** - Develop a comprehensive program to conserve energy resources at City-operated facilities.

Policy NR.7.2 - Promote the development and use of advanced energy technology and building materials in Rancho Cordova.

Cross reference: LU.2.7

Policy NR.7.3 - Encourage the development of energy efficient buildings and subdivisions.

- **Action NR 7.3.1** - Offer incentives (e.g., reduced fees, expedited entitlement processing, density bonus) for plans/projects that exceed Title 24 energy efficiency requirements by ten percent.

Policy NR.7.4 - Promote energy rebate programs offered by local energy providers (e.g., SMUD, PG&E) as a way to bring energy efficiency into older neighborhoods and developments.

- **Action NR.7.4.1** - Consider the following items as ways to implement this policy:
  - Fund a program that offers incentives for adding energy efficient systems into existing developments;
  - Work with local utility providers to make the public aware of energy rebate programs; and
  - Work with community organizations, such as SMUD, to encourage the inclusion of energy efficient systems in remodels and retrofits of existing development.

GOAL NR.8 - PROMOTE WASTE REDUCTION, REUSE, RECYCLING, AND COMPOSTING EFFORTS.

Policy NR.8.1 - Support recycling efforts by developing a set of programs to educate residents on recycling and provide recycling services.

- **Action NR.8.1.1 -** Continue providing curbside recycling and green waste service to all single-family and duplex residences in Rancho Cordova.
- **Action NR.8.1.2** - Create and facilitate a series of educational workshops for the public and businesses on composting and recycling. Provide at least one program to increase recycling by occupants of multi-family housing.
- **Action NR.8.1.3** - Encourage all office, commercial, and multi-family complexes to provide recycling bins and collection service for paper, plastic, glass, and metal.
- **Action NR.8.1.4** - Provide recycling centers at City facilities (e.g., City Hall, libraries) that are available to the public free-of-charge.

- **Action NR.8.1.5** - Provide locations for household hazardous wastes to be recycled.

- **Action NR.8.1.6** – Remove impediments to successful recycling.

Policy NR.8.2 - Encourage all companies that do business in Rancho Cordova to recycle and reuse construction scraps, demolition materials, concrete, industrial waste, and green waste.

- **Action NR.8.2.1** - Encourage the school districts within the Planning Area to support recycling at school sites by placing easily accessible recycling bins, providing educational programs on recycling, and using recycled products.

Cross reference: N.1.5

Policy NR.8.3 - Promote the use of rubberized asphalt on all public roadways in an effort to recycle old tires and reduce noise impacts. Implementation of this policy will help to preserve aggregate resources.

Policy NR.8.4 - Encourage the use of recycled materials and source reduction (also known as waste prevention) by governmental agencies and local businesses.

- **Action NR.8.4.1** - Ensure that at least 50 percent of the City's office supply purchases are comprised of recycled or reusable products.

Policy NR.8.5 - Meet state mandates for solid waste reduction and recycling. Increase recycling efforts beyond those required by state law through supporting businesses that buy and sell re-used materials, such as materials exchange centers.

- **Action NR.8.5.1** - Implement the State's source reduction and recycling element (required by the California Integrated Waste Management Act) and the household hazardous waste element (required by PRC 41500-41510).

Policy NR.8.6 - Encourage the use of recycled-content products and construction materials.

Policy NR.8.7 - Maintain contact with Sacramento County and Allied Waste (or its successor) regarding the capacity projections of Kiefer Landfill and Lockwood Landfill to ensure an adequate capacity in their disposal facilities for the long-term disposal needs of Rancho Cordova.

TABLE NR-1
SPECIAL STATUS SPECIES OCCURRING WITHIN THE RANCHO CORDOVA PLANNING AREA

Scientific Name	Common Name	State Listing Status	Federal Listing Status	Other Status
Plant Species				
Downingia pusilla	Dwarf downingia	None	None	CNPS:2 R-E-D: 1-2-1
Gratiola heterosepala	Boggs Lake hedge-hyssop	Endangered	None	CNPS: 1B R-E-D: 1-2-2 USFWS: SC
Juncus leiospermus	Ahart's dwarf rush	None	None	CNPS: 1B R-E-D: 3-2-3 USFWS: SC
Legenere limosa	Legenere	None	None	CNPS: 1B R-E-D: 2-3-3 USFWS: SC
Narvarretia myersii ssp. myersi	Pincushion navarretia	None	None	CNPS: 1B R-E-D: 3-3-3 USFWS: SC
Orcuttia tenuis	Slender orcutt grass	Endangered	Threatened	CNPS: 1B R-E-D: 2-3-3
Orcuttia viscida	Sacramento orcutt grass	Endangered	Endangered	CNPS: 1B R-E-D: 3-3-3
Sagittaria sanfordii	Sanford's arrowhead	None	None	CNPS: 1B R-E-D: 2-2-3 USFWS: SC
Amphibian Species				
Spea (Scaphiopus) hammondii	Western spadefoot	None	None	CDFG: CSC USFWS: SC
Bird Species				
Accipiter cooperii	Cooper's hawk	None	None	CDFG: CSC
Agelaius tricolor	Tricolored blackbird	None	None	CDFG: CSC USFWS: SC
Ardea alba	Great egret	None	None	

Scientific Name	Common Name	State Listing Status	Federal Listing Status	Other Status
Ardea herodias	Great blue heron	None	None	
Asio flammeus (nesting)	Short-eared Owl	None	None	CDFG: CSC
Athene cunicularia (burrow sites)	Burrowing owl	None	None	CDFG: CSC USFWS: SC
Buteo swainsoni	Swainson's hawk	Threatened	None	
Circus cyaneus (nesting)	Northern harrier	None	None	CDFG: CSC
Elanus leucurus	White-tailed kite	None	None	CDFG: fully protected
Eremophila alpestris actia	California horned lark	None	None	CDFG: CSC
Icteria virens (nesting)	Yellow-breasted chat	None	None	CDFG: CSC
Lanius ludovicianus (nesting)	Loggerhead shrike	None	None	CDFG: CSC USFWS: SC
Plegadis chihi (rookery site)	White-faced ibis	None	None	CDFG: CSC USFWS: SC
Riparia riparia	Bank swallow	Threatened	None	
Invertebrate Species				
Branchinecta lynchi	Vernal pool fairy shrimp	None	Threatened	
Branchinecta mesovallensis	Midvalley fairy shrimp	None	None	USFWS: SC
Desmocerus californicus dimorphus	Valley elderberry longhorn beetle	None	Threatened	
Lepidurus packardi	Vernal pool tadpole shrimp	None	Endangered	
Linderiella occidentalis	California linderiella (fairy shrimp)	None	Endangered	USFWS: SC
Mammal Species				
Antrozous pallidus	Pallid bat	None	None	CDFG: CSC
Bassariscus astutus	Ringtail	None	None	CDFG: CFP

Scientific Name	Common Name	State Listing Status	Federal Listing Status	Other Status
Myotis ciliolabrum	Western small-footed myotis	None	None	USFWS: SC
Myotis evotis	Long-eared myotis	None	None	USFWS: SC
Myotis thysanodes	Fringed myotis	None	None	USFWS: SC
Myotis volans	Long-legged myotis	None	None	USFWS: SC
Myotis yumaensis	Yuma myotis	None	None	USFWS: SC
Taxidea taxus	American badger	None	None	CDFG: CSC
Reptile Species				
Emys (=Clemmys) marmorata marmorata	North-western pond turtle	None	None	CDFG: CSC USFWS: SC

Key to Ranks and Lists

CDFG: CSC	California Species of Special Concern
CDFG: CFP	California Fully Protected
USFWS: SC	USFWS Species of Concern

CNPS Lists:

List 1A: Plants Presumed Extinct in California
List 1B: Plants Rare, Threatened or Endangered in California or Elsewhere
List 2: Plants Rare, Threatened or Endangered in California, But More Common Elsewhere
List 3: Plants About Which We Need More Information – A Review List
List 4: Plants of Limited Distribution – A Watch List

Scientific Name	Common Name	State Listing Status	Federal Listing Status	Other Status
CNPS R-E-D Codes:				

R Rarity

1 Rare, but found in sufficient numbers and distributed widely enough that the potential for extinction is low at this time

2 Distributed in a limited number of occurrences, occasionally more if each occurrence is small

3 Distributed in one to several highly restricted occurrences, or present in such small numbers that it is seldom reported

E Endangerment

1 Not Endangered

2 Endangered in a portion of its range

3 Endangered throughout its range

D Distribution

1 More or less widespread outside California

2 Rare outside California

3 Endemic to California

Appendix B — Regionally Occurring Listed and Special-Status Species

Regulatory Status Legend

FE = Federal endangered FT = Federal threatened FC = Federal candidate PT = Federal proposed threatened FPD = Federal proposed for delisting FD = Federal delisted FSC = Federal Species of Concern	CE = California state endangered CT = California state threatened CFP = California fully protected CSC = California Species of Special Concern CSA = California Special Animals List CR = California state rare	1A = plants presumed extinct in California 1B = plants rare, threatened, or endangered in California and elsewhere 2 = plants rare, threatened, or endangered in California, but common elsewhere 3 = plants about which we need more information 4 = plants of limited distribution

DRAFT

Table 1 — Legally Protected Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Boggs Lake hedge-hyssop *Gratiola heterosepala*	--; CE; SLC; 1B	Annual herb found in shallow ponds and margins of vernal pools from 30 to 7800 feet above sea level.	April – June	**None**; Though, the vernal pools within the Study Area provide habitat for this species, this species was not observed during the June 12 and 13, 2017, rare plant survey. There are five CNDDB occurrences within five miles of the Study Area.
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE; --; --; 1B	Annual herb found in open pine forests and oak woodlands on gabbroic soils from 300 to 2000 feet above sea level.	May – June	**None**; the Study Area does not provide habitat for this species.
Ione manzanita *Arctostaphylos myrtifolia*	FT; --; --; 1B	Perennial evergreen shrub found in chaparral and open woodlands on Ione soils from 200 to 2000 feet.	November – March	**None**; the Study Area does not provide habitat for this species.
Ione buckwheat *Eriogonum apricum* var. *apricum*	FE; CE; --; 1B	Perennial herb found in chaparral on Ione soil from 200 to 500 feet.	July – October	**None**; the Study Area does not provide habitat for this species.
Irish Hill buckwheat *Eriogonum apricum* var. *prostratum*	FE; CE; --; 1B	Perennial herb found in chaparral on Ione soil from 300 to 400 feet above sea level.	June – July	**None**; the Study Area does not provide habitat for this species.
Layne's ragwort *Packera layneae*	FT; --; --; 1B	Perennial herb found in chaparral and oak and pine woodlands on rocky serpentine or gabbroic soil from 600 to 3500 feet.	April – August	**None**; the Study Area does not provide habitat for this species.
Pine Hill ceanothus *Ceanothus roderickii*	FE; --; --; 1B	Perennial evergreen shrub found in chaparral and oak and pine woodlands on serpentine or gabbroic soils from 800 to 3500 feet.	April – June	**None**; the Study Area does not provide habitat for this species.
Pine Hill flannelbush *Fremontodendron decumbens*	FE; --; --; 1B	Perennial evergreen shrub found in chaparral and oak and pine woodlands on rocky gabbroic or serpintine soils from 1400 to 2500 feet above sea level.	April – July	**None**; the Study Area does not provide habitat for this species.
Sacramento Orcutt grass *Orcuttia viscida*	FE; CE; SLC; 1B	Annual herb found in vernal pools from 100 to 350 feet above sea level. It is known only in Sacramento County.	April – July	**None**; Though, the vernal pools within the Study Area provide habitat for this species, this species was not observed during the June 24, 2009, and June 12 and 13, 2017, rare plant surveys. There are eight CNDDB occurrences within five miles of the Study Area.
Slender Orcutt grass *Orcuttia tenuis*	FT; CE; SLC; 1B	Annual herb found in vernal pools and the margins of stock ponds from 100 to 5700 feet above sea level.	May – July	**None**; Though, the vernal pools within the Study Area provide habitat for this species, this species was not observed during the June 24, 2009, and June 12 and 13, 2017, rare plant surveys. There is one CNDDB occurrence within five miles of the Study Area.
Invertebrates				
Conservancy fairy shrimp *Branchinecta conservatio*	FE; --; --; --	Crustacean found in vernal pools from 10 to 500 feet above sea level. This species if found in Butte, Tehama, Glenn, Yolo, Solano, Stanislaus, Merced, and Ventura counties.	Wet season	**None**; the project site is outside of the known range for this species.
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT; --; SLC; --	Insect found in riparian areas of chaparral and oak woodland up to 500 feet above sea level. Species leaves bore holes on the trunk of its host plant, blue elderberry shrub.	Year-round	**None**; the Study Area does not provide habitat for this species. There are five CNDDB occurrences within 5 miles of the Study Area.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT; --; SLC; --	Crustacean found in vernal pools and similar ephemeral wetlands.	Wet season	**High**; the vernal pools and other wetlands within the Study Area provide habitat for this species. There are 22 CNDDB occurrences within five miles of the Study Area.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE; --; SLC; --	Crustacean found in vernal pools and similar natural and artificial seasonally ponded waterbodies.	Wet season	**Present**; this species was observed by a Foothill biologist during a 2004 reconnaissance survey. There are 43 CNDDB occurrences within five miles of the Study Area.
Fish				
Central Valley steelhead *Oncorhynchus mykiss irideus*	FT; --; CSC; --	Salmonid found in the ocean, rivers, creeks, and lakes. They can survive for extended periods in waters up to 70° F.	Year-round	**None**; the Study Area does not provide habitat for this species.
Delta smelt *Hypomesus transpacificus*	FT; CE; --; --	Found in bays, rivers, and sloughs.	Year-round	**None**; the Study Area does not provide habitat for this species.

DRAFT

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Amphibians/ Reptiles				
California red-legged frog *Rana draytonii*	FT; CSC; --; --	Found in or near quiet, permanent waterbodies. Individuals may range up to a mile from water along riparian corridors.	Summer	**None**; the Study Area is not within the known extant range of this species.
California tiger salamander *Ambystoma californiense*	FT; CT; SLC; --	Found in grasslands and pine and oak woodlands. Breeds in ponded water. Spends summers in small mammal burrows. Found in the Central Valley from Kern to Yolo County.	November – February	**None**; though the grassland, burrows, and detention basin outfall of the Study Area provide habitat for this species, the Study Area is outside of the know range for this species and this species has not been observed during previous focused surveys.
Giant garter snake *Thamnophis gigas*	FT; CT; SLC; --	Agricultural wetlands, irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and associated uplands.	Spring – Fall	**None**; The Study Area does not provide habitat for this species.
Birds				
Western snowy plover *Charadrius alexandrinus nivosus*	FT; CSC; --; --	Nests on beaches.	Spring – Fall (Nesting)	**None**; the Study Area does not provide nesting habitat for this species.
Bank swallow *Riparia*	--; CT; --; --	Nests in large colonies, excavating nest burrows in steep riverbank cliffs, gravel pits, and highway cuts.	Spring – Fall (Nesting)	**None**; the Study Area does not provide habitat for this species.
White-tailed kite *Elanus leucurus*	--; CFP; SLC; --	Found in savanna, open woodland, marshes, and fields. Nests in isolated trees or woodlands areas with open foraging habitat.	Year-round	**Present**; this species was observed foraging within the Study Area during the June 12, 2017, rare plant survey.
California black rail *Laterallus jamaicensis*	BCC; CT; --; --	Found in coastal and freshwater marshes.	Year-round	**None**; the Study Area does not provide habitat for this species.
Bald eagle *Haliaeetus leucocephalus*	BCC; CE; --; --	Nests in mountainous habitats near permanent waterbodies. Winters near permanent waterbodies.	Year-round (Nesting and Wintering)	**None**; the Study Area does not provide habitat for this species.

Table 1 includes federal threatened or endangered species and eagles, and State threatened, endangered, or fully protected species.

DRAFT

Table 2 — Species Subject to CEQA Review

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	--; --; SLC; 1B	Annual herb found in vernal pool margins and grasslands from 100 to 330 feet above sea level.	March – May	**Low**; the vernal pool margins within the Study Area provide habitat for this species, though this species was not observed during previous focused botanical surveys. There are two CNDDB occurrences within five miles of the Study Area.
Dwarf downingia *Downingia pusilla*	--; --; SLC; 2	Annual herb found in vernal pools and grasslands from sea level to 1500 feet above sea level.	March – May	**Low**; the vernal pools and grasslands within the Study Area provide habitat for this species.
El Dorado mule ears *Wyethia reticulata*	--; --; --; 1B	Perennial herb found in chaparral, pine and oak woodlands, and coniferous forests on clay or gabbroic soil from 1000 to 1500 feet above sea level.	April – August	**None**; the Study Area does not provide habitat for this species.
Legenere *Legenere limosa*	--; --; SLC; 1B	Annual herb found in vernal pools from 10 to 3000 feet above sea level.	April – June	**None;** Though the vernal pools within the Study Area provide habitat for this species, this species was not observed during the June 12 and 13, 2017, rare plant survey. There are 13 CNDDB occurrences within five miles of the Study Area.
Pincushion navarretia *Navarretia myersii* ssp. *myersii*	--; --; --; 1B	Annual herb found in vernal pools from 60 to 1000 feet above sea level.	April – May	**Low**; the vernal pools within the Study Area provide habitat for this species.
Parry's horkelia *Horkelia parryi*	--; --; --; 1B	Perennial herb found in chaparral and pine and oak woodlands from 250 to 3000 feet above sea level.	April – September	**None**; the Study Area does not provide habitat for this species.
Red Hills soaproot *Chlorogalum grandiflorum*	--; --; --; 1B	Perennial herb found in chaparral, pine and oak woodlands, and coniferous forests from 800 to 5500 feet above sea level.	May – June	**None**; the Study Area does not provide habitat for this species.
Sanford's arrowhead *Sagittaria sanfordii*	--; --; SLC; 1B	Perennial emergent herb found in marshes and swamps from 0 to 2,200 feet above sea level.	May - October	**None**; the Study Area does not provide habitat for this species.
Tuolumne button-celery *Eryngium pinnatisectum*	--; --; --; 1B	Annual to perennial herb found in pine and oak woodlands, coniferous forests, and vernal pools from 200 to 3000 feet above sea level.	May – August	**None;** Though the vernal pools and grassland within the Study Area provide habitat for this species, this species was not observed during the June 12 and 13, 2017, rare plant survey.
Invertebrates				
California linderiella *Linderiella occidentalis*	--; CSA; --; --	Vernal pools, swales, and ephemeral freshwater habitat.	Wet season	**High**; the vernal pools within the Study Area provide habitat for this species. There are 25 CNDDB occurrences within five miles of the Study Area.
Amphibians/ Reptiles				
Western spadefoot *Spea hammondii*	--; CSC; SLC; --	Toad found in grasslands, chaparral, and pine and oak woodlands up to 4,500 feet above sea level. Breeds in seasonal wetland habitat including vernal pools.	Wet season	**High**; the grassland of the Study Area provide habitat for this species and there is suitable breeding habitat onsite. There is one CNDDB occurrence within five miles of the Study Area.
Northwestern western pond turtle *Emys marmorata*	--; CSC; SLC; --	Found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches, with abundant vegetation, and either rocky or muddy bottoms, in woodlands, forests, and grassland.	November – February	**None**; the Study Area does not provide habitat for this species. There are two CNDDB occurrences within five miles of the Study Area.
Birds				
Allen's hummingbird *Selasphorus sasin*	BCC; --; --; --	Found in chaparral, thickets, oak woodland, mixed evergreen forests, coniferous forests, riparian woodland, and residential areas.	Spring, Fall	**None**; the Study Area does not provide habitat for this species.
Cooper's hawk *Accipiter cooperii*	--; CWL; SLC; --	Nests in riparian corridors. Forages in woodlands and riparian areas.	Spring – Fall (Nesting)	**None**; the Study Area does not provide habitat for this species.
Costa's hummingbird *Calypte costae*	BCC; --; --; --	Found in desert, semi-desert, brush foothills, and chaparral.	Spring – Fall (Nesting)	**None**; the Study Area does not provide habitat for this species.
Double-crested cormorant *Phalacrocorax auritus*	--; CSA; --; --	Found in lakes, ponds, rivers, lagoons, swamps, coastal bays, marine islands, and seacoasts.	Spring (Nesting Colony)	**None**; the Study Area does not provide habitat for this species.

DRAFT

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Ferruginous hawk *Buteo regalis*	BCC; CFP; SLC; --	Found in open habitats in grasslands, shrub steppes, sagebrush, deserts, saltbush-greasewood shrublands, and outer edges of pinyon-pine and other forests.	Winter	**High**; the grassland of the Study Area provides suitable wintering habitat for this species. There is one CNDDB occurrence within five miles of the Study Area.
Golden eagle *Aquila chrysaetos*	--; CFP; --; --	Found in open to semi-open prairie, sagebrush, arctic and alpine tundra, savannah or sparse woodland.	Year-round	**High**; the grassland of the Study Area provides suitable foraging habitat for this species. There is one CNDDB occurrence within five miles of the Study Area.
Grasshopper sparrow *Ammodramus savannarum*	BCC; CSC; --; --	Found in grasslands with sparse coverage of woody vegetation.	Spring – Fall (Nesting)	**Low**; the grassland of the Study Area provides habitat for this species.
Great blue heron *Ardea herodias*	--; CSA; --; --	Found in marshes, lakes, rivers, bays, lagoons, ocean beaches, mangroves, fields, and meadows. Nests high in trees.	Spring – Fall (Nesting colony)	**None**; the grassland of the Study Area provides foraging habitat for this species and this species was observed flying over the Study Area during the June 12, 2017, rare plant survey. However, there is no nesting habitat within the Study Area.
Great egret *Ardea alba*	--; CSA; --; --	Found in marshes, swampy woods, tidal estuaries, lagoons, mangroves, streams, lakes, fields, and meadows.	Spring – Fall (Nesting colony)	**None**; the grassland of the Study Area provides foraging habitat for this species. There is no nesting habitat within the Study Area.
Lewis' woodpecker *Melanerpes lewis*	BCC; --; --; --	Found in coniferous forests and oak woodlands.	Spring – Fall (Nesting)	**None**; the Study Area does not provide habitat for this species.
Loggerhead shrike *Lanius ludovicianus*	BCC; CSC; SLC; --	Found in open habitats with scattered shrubs, trees, posts, fences and utility lines for perches. Nests in densely foliaged tree or shrub.	Spring – Fall (Nesting)	**Low**; the Study Area provides foraging habitat for this species.
Long-billed curlew *Numenius americanus*	BCC; --; --; --	Found in mudflats and shallow marsh areas.	Spring (Nesting)	**None**; the Study Area does not provide habitat for this species.
Marbled godwit *Limosa fedoa*	BCC; --; --; --	Found in marshes and flooded plains.	Winter	**None**; the Study Area does not provide habitat for this species.
Merlin *Falco columbarius*	--; CWL; --; --	Found in marshes, deserts, seacoasts, lagoons, open pine and oak woodlands, and fields.	Winter	**Low**; the grassland of the Study Area provides habitat for this species.
Mountain plover *Charadrius montanus*	BCC; CSC; --; --	Winters in California in agricultural fields and grasslands.	Winter	**Low**; the grassland of the Study Area provides suitable wintering habitat for this species.
Nuttall's woodpecker *Picoides nuttallii*	BCC; --; --; --	Found in low-elevation riparian deciduous and oak habitats.	Year-round	**None**; the Study Area does not provide habitat for this species.
Oak titmouse *Baeolophus inornatus*	BCC; --; --; --	Found in oak savannah and oak woodlands.	Spring – Fall (Nesting)	**None**; the Study Area does not provide habitat for this species.
Peregrine falcon *Falco peregrinus*	BCC; CFP; --; --	Found in open areas near cliffs including tundra, moorlands, steppe, seacoasts, mountains, forests, and urban areas.	Spring – Fall (Nesting)	**None**; the Study Area does not provide nesting habitat for this species.
Rufous hummingbird *Selasphorus rufus*	BCC; --; --; --	Nests within berry tangles, shrubs, and conifers.	Spring (Nesting)	**None**; the Study Area does not provide nesting habitat for this species.
Short-eared owl *Asio flammeus*	--; CSC; --; --	Found in marshes, bogs, dunes, prairies, grassy plains, old fields, tundra, moorland, river valleys, meadows, savanna, open woodland, and heathland.	Spring – Fall (Nesting)	**Low**; the grassland of the Study Area provides habitat for this species.
Swainson's hawk *Buteo swainsoni*	BCC; CT; SLC; --	Found in savanna, open pine-oak woodland and cultivated lands with scattered trees.	Spring – Fall (Nesting)	**None**; the project site does not provide nesting habitat for this species. There are 11 CNDDB occurrences within five miles of the Study Area.
Tricolored blackbird *Agelaius tricolor*	BCC; CCE; SLC; --	Nests in dense blackberry, cattail, tules, willow, or wild rose within emergent wetlands.	Spring – Fall (Nesting colony)	**None**; the Study Area does not provide nesting habitat for this species.
Western burrowing owl *Athene cunicularia*	BCC; CSC; SLC; --	Nests in burrows in the ground, often in old ground squirrel burrows or badger, within open dry grassland and desert habitat.	Year-round	**High**; the grassland and burrows of the Study Area provide habitat for this species. There are 12 CNDDB occurrences within five miles of the Study Area.
Western grebe *Aechmophorus occidentalis*	BCC; --; --; --	Found in marshes, lakes, and bays.	Year-round	**None**; the Study Area does not provide habitat for this species.
Williamson's sapsucker *Sphyrapicus thyroideus*	BCC; --; --; --	Found in coniferous forests year-round and oak and pine woodland in winter.	Year-round	**None**; the Study Area does not provide habitat for this species.

DRAFT

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Mammals				
American badger *Taxidea taxus*	--; CSC; SLC; --	Found in open areas and brushlands.	Year-round	**Low**; the grassland of the Study Area provides habitat for this species.
Pallid bat *Antrozous pallidus*	--; CSC; --; --	Found in mountainous areas, intermontane basins, lowland desert scrub, arid deserts, grasslands, and coniferous forests	Spring - Fall	**Low**; the grassland of the Study Area provides habitat for this species.
Silver-haired bat *Lasionycteris noctivagans*	--; CSA; --; --	Found in coniferous forests near lakes, ponds, and streams.	Spring - Fall	**None**; the Study Area does not provide habitat for this species.

Table 2 includes state and federal species of concern and Rank 1 and 2 CNPS species.

Table 3 — Other Species of Interest

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Bisbee peak rush-rose *Crocanthemum suffrutescens*	--; --; --; 3	Perennial evergreen shrub found in chaparral from 250 to 2,200 feet above sea level.	Apr – August	**None**; the Study Area does not provide habitat for this species.
Brandegee's clarkia *Clarkia biloba* ssp. *brandegeeae*	--; --; --; 4	Annual herb found in chaparral, pine and oak woodlands, and coniferous forests from 250 to 3,000 feet above sea level.	May – July	**None**; the Study Area does not provide habitat for this species.
Brewer's calandrina *Calandrinia breweri*	--; --; --; 4	Annual herb found in disturbed sites and burns in chaparral and coastal scrub on sandy or loamy soil from 30 to 4,000 feet above sea level.	March - June	**None**; the Study Area does not provide habitat for this species.
Hoary navarretia *Navarretia eriocephala*	--; --; --; 4	Annual herb found in pine and oak woodlands and grasslands from 30 to 1,300 feet above sea level.	May – June	**Low**; the grassland of the Study Area provides habitat for this species.
Jepson's wooly sunflower *Eriophyllum jepsonii*	--; --; --; 4	Perennial herb found in chaparral, pine and oak woodlands, and coastal scrub from 650 to 3400 feet above sea level.	Apr – June	**None**; the Study Area does not provide habitat for this species.
Stinkbells *Fritillaria agrestis*	--; --; --; 4	Perennial bulbiferous herb found in chaparral, pine and oak woodlands, pinyon and juniper woodlands, and grasslands from 30 to 5100 feet above sea level.	Mar – June	**None**; the Study Area does not provide habitat for this species.
Invertebrates				
Blennosperma vernal pool andrenid bee *Andrena blennospermatis*	--; CSA; --; --	Found in upland areas near vernal pools.	Spring - Fall	**Low**; the upland grassland near vernal pools of the Study Area provides habitat for this species.
Andrenid bee *Andrena subapasta*	--; CSA; --; --	Found near grassland forbs.	Spring – Fall	**Low**; the grassland of the Study Area provides habitat for this species.
Ricksecker's water scavenger beetle *Hydrochara ricksecker*i	--; CSA; SLC; --	Found in shallow water.	Summer – Fall	**Low**; the vernal pools and other wetlands within the Study Area provide habitat for this species.
Hairy water flea *Dumontia oregonensis*	--; CSA; --; --	Found in shallow water.	Summer – Fall	**Low**; the vernal pools and other wetlands within the Study Area provide habitat for this species.
Mid-valley fairy shrimp *Branchinecta mesovallensis*	--; CSA; SLC; --	Crustacean found in vernal pools, vernal swales, and other ephemeral water bodies.	Wet season	**Low**; the vernal pools and other wetlands within the Study Area provide habitat for this species.

Table 3 includes Rank 3 and 4 CNPS species and non-listed invertebrates, which may not be subject to CEQA review.

Zenaida macroura	Mourning dove

APPENDIX C.3

Special-Status Plant Survey

October 20, 2017

Roseville, CA 95661

RE: Special-Status Plant Survey for The Ranch (Jaeger 530) Project located in the City of Rancho Cordova, Sacramento County, California

Dear Ms. Sciorelli:

This report summarizes the results of the focused botanical survey for special-status plant species on The Ranch Project (aka Jaeger 530) (Project Site), located in Sacramento County, California. The survey was conducted in accordance with and subject to guidelines provided by the California Department of Fish and Wildlife (CDFW) and the California Native Plant Society (CNPS). The purpose of the survey was to determine whether three special-status plants, Sacramento Orcutt grass (*Orcuttia viscida*), slender Orcutt grass (*Orcuttia tenuis*), and Boggs lake hedge-hyssop (*Gratiola heterosepala*), occur within the Project Site.

LOCATION

The Project Site is located in southeastern Sacramento County, approximately five miles south of U.S. Highway 50, immediately east of Rancho Cordova Parkway, and north of Jackson Road (Highway 16) within the City of Rancho Cordova. The Project Site is located in Township 8 North, Range 7 East, Section 16 within the 7.5-minute USGS *Buffalo Creek, California* quadrangle (**Figure 1**).

METHODOLOGY

Two Foothill Associates' biologists conducted a focused botanical survey within the evident and identifiable blooming period of the potentially occurring special-status species listed in this letter on June 12 and 13, 2017.

Transects were systematically walked throughout the whole of the Project Site, with special attention paid to areas that contained suitable habitat for the special-status plant species. In this case, five-foot transects were walked throughout each vernal pool on the Project Site and all riverine wetland features were surveyed.

DRAFT

The survey was conducted by two biologists with the following qualifications: experience with conducting floristic surveys; intimate knowledge of plant taxonomy and plant community ecology and classification; familiarity with the plants of the area, including special-status and locally significant plants; familiarity with the appropriate State and federal statutes related to plants and plant collecting; and experience with analyzing impacts of project activities on native plants and plant communities.

ENVIRONMENTAL SETTING

The Project Site consists of approximately 530 acres of land that comprises non-native annual grassland as well as 21.42 acres of various wetland features including: vernal pools (15.39 acres), depressional seasonal wetlands (2.80 acres), riverine seasonal wetlands (1.68 acres), and intermittent drainages (1.55 acres). The general topography of the Project Site is gently sloping from approximately 176 feet above mean sea level (MSL) in the southwest corner to 192 feet above MSL in the northeast corner of the Project Site (54 to 59 meters). The majority of the Project Site (approximately 356 acres) is proposed for development including residential housing, parks, a shopping center, and detention basins. Approximately 174 acres will be preserved in perpetuity.

RESULTS AND CONCLUSIONS

Although the Project Site contains potential habitat for three special-status plant species, these species were not observed during the botanical survey. One *Gratiola* species was observed and identified to species (*Gratiola ebracteata*), a common gratiola. Dominant plant species observed in the uplands on the Project Site include: medusahead rye (*Elymus caput-medusae*), Italian rye grass (*Festuca perennis*), rattail sixweeks grass (*Festuca myuros*), barley (*Hordeum murinum*), oat (*Avena* sp.), wild rye (*Elymus* sp.), spikeweed (*Centromadia fitchii*), rose clover (*Trifolium hirtum*), and long-beaked filaree (*Erodium botrys*). Dominant species observed within the wetland features on the Project Site include: coyote thistle (*Eryngium vaseyi*), spikerush (*Eleocharis macrostachya*), seaside barley (*Hordeum marinum*), woolly marbles (*Psilocarpus brevissimus*), hyssop loosestrife (*Lythrum hyssopifolium*), rabbitsfoot grass (*Polypogon monspeliensis*), Fremont's goldfields (*Lasthenia fremontii*), and toad rush (*Juncus bufonius*). A complete list of plants observed within the Project Site is enclosed as **Attachment A** of this report.

If you have any questions please contact me at your earliest convenience at (916) 435-1202 or via email at zneider@foothill.com.

Sincerely,

Zachary Neider
Biologist

INTRODUCTION

The project involves the residential development of a 530 acre tract of land. The parcel lies on the east side of Jaeger Road, south of Douglas Road, and one mile east of Sunrise Boulevard (Figure 1). The project area is located includes the southern portion of section 16, Township 8 north, Range 7 east, mapped on the Buffalo Creek United States Geological Survey 7.5 minute quadrangle.

Because the proposed work will require Clean Water Act (CWA) permitting from the United States Army Corps of Engineers, the applicant will participate as a consulting party to assist the federal agency in demonstrating compliance with Section 106 of the NHPA (16 U.S.C. 470f; regulations codified at 36 CFR § 800).

Melinda A. Peak, senior historian with Peak & Associates, Inc. served as principal investigator for the study, with Ann Peak directing the field survey team (resumes, Appendix 1).

REGULATORY CONTEXT

The Section 106 review process is implemented using a five step procedure: 1) identification and evaluation of historic properties; 2) assessment of the effects of the undertaking on properties that are eligible for the National Register; 3) consultation with the State Historic Preservation Office (SHPO) and other agencies for the development of a memorandum of agreement (MOA) that addresses the treatment of historic properties; 4) receipt of Advisory Council on Historic Preservation comments on the MOA or results of consultation; and 5) the project implementation according to the conditions of the MOA.

The Section 106 compliance process may not consist of all the steps above, depending on the situation. For example, if identification and evaluation result in the documented conclusion that no properties included in or eligible for inclusion are present, the process ends with the identification and evaluation step.

FRAMEWORK FOR EVALUATION

Decisions regarding management of cultural resources hinge on determinations of their significance (36 CFR 60.2). As part of this decision-making process the National Park Service has identified components which must be considered in the evaluation process, including:

- o criteria for significance;

- o historic context; and
- o integrity.

Criteria for Significance

Significance of cultural resources is measured against the National Register criteria for evaluation:

> The quality of significance in American history, architecture, archeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association, and,
>
> (a) that are associated with events that have made a significant contribution to the broad patterns of our history; or
>
> (b) that are associated with the lives of persons significant in our past; or
>
> (c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
>
> (d) that have yielded, or may be likely to yield, information important in prehistory or history (36 CFR 60.4).

Historic Context

The historic context is a narrative statement "that groups information about a series of historic properties based on a shared theme, specific time period, and geographical area" To evaluate resources in accordance with federal guidelines, these sites must be examined to determine whether they are examples of a defined "property type". The property type is a "grouping of individual properties based on shared physical or associative characteristics". Through this evaluation, each site is viewed as a representative of a class of similar properties rather than as a unique phenomenon.

A well developed historical context helps determine the association between property types and broad patterns of American history. Once this linkage is established, each resource's potential to address specific research issues can be explicated.

Integrity

For a property to be eligible for listing in the National Register it must meet one of the criteria for significance (36 CFR 60.4 [a ,b, c, or d]) and retain integrity. Integrity is defined as "the authenticity of a property's historic identity, evidenced by the survival of physical characteristics that existed during the property's historic or prehistoric period".

The following discussion is derived from National Register Bulletin 15 ("How to Apply the National Register Criteria for Evaluation").

Within the concept of integrity, there are seven aspects or qualities that define integrity in various combinations. The seven aspects are: location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity, a property will possess several or usually most of these aspects. The retention of specific aspects is necessary for a property to convey this significance. Determining which of the seven aspects are important involves knowing why, where and when the property is significant.

The prescribed steps in assessing integrity are as follows:

- define the essential physical features that must be present for a property to represent its significance;
- determine whether the essential physical features are visible enough to convey their significance;
- determine whether the property needs to be compared with similar properties; and,
- determine, based on the significance and essential physical features, which aspects of integrity are particularly vital to the property being nominated and if they are present.

Ultimately, the question of integrity is answered by whether or not the property retains the identity for which it is significant.

All properties change over time. It is not necessary for a property to retain all its historic physical features or characteristics. However, the property must retain the essential physical features that enable it to convey its historic identity. The essential physical features are those features that define why a property is significant.

A property's historic significance depends on certain aspects of integrity. Determining which of the aspects is most important to a particular property requires an understanding of the property's significance and its essential physical features. For example, a property's historic significance can be related to its association with an important event, historical pattern or person. A property that is significant for its historic association is eligible for listing if it retains the essential physical

features that made up its character or appearance during the period of its association with the important event, historical pattern, or person.

A property important for association with an event, historical pattern, or person ideally might retain some features of all seven aspects of integrity. Integrity of design and workmanship, however, might not be as important to the significance, and would not be relevant if the property were an archeological site. A basic integrity test for a property associated with an important event or person is whether a historical contemporary would recognize the property as it exists today. For archeological sites that are eligible under Criteria a and b, the seven aspects of integrity can be applied in much the same way as they are to buildings, structures, or objects.

In sum, the assessment of a resource's National Register eligibility hinges on meeting two conditions:

- the site must possess the potential to be eligible for listing in the National Register under one of the evaluation criteria either individually or as a contributing element of a district based on the historic context that is established; and

- the site must possess sufficient integrity, i.e. it must retain the qualities that make it eligible for the National Register.

For the National Register, "a district possesses a significant concentration, linkage, or continuity of ... objects united historically or aesthetically by plan or physical development." The identity of a district derives from the relationship of its resources, which can be an arrangement of functionally related properties.

CULTURAL HISTORY

Archeological Background

The Sacramento Delta was one of the first regions in California to attract intensive archeological fieldwork. Between 1893 and 1901, avocational archeologist J. A. Barr excavated many prehistoric mounds in the Stockton area. He collected nearly 2000 artifacts during the course of his investigations. H. C. Meredith was another avocational archeologist of the period who pursued collecting in the same Stockton locality. Meredith (1899, 1900) did publish a compilation of his own and Barr's findings, and these appear to constitute the earliest accounts of delta archeology. Holmes (1902), from the Smithsonian Institution, further elaborated on the delta or "Stockton District" archeology, presenting illustrations of artifacts collected by Meredith and Barr.

It was Elmer J. Dawson who first recognized culture changes through time in delta archeology. Though he was an amateur archeologist, Dawson understood the necessity of keeping accurate

notes on grave associations and provenience of artifacts. He collaborated with W. E. Schenck to produce an overview of northern San Joaquin Valley archeology (Schenck and Dawson 1929). The overview contained information on more than 90 prehistoric sites as well as data on previous collectors.

By 1931, the focus of archeological work was directed toward the Cosumnes River locality, where survey and exploration were conducted by Sacramento Junior College (Lillard and Purves 1936). Excavations, especially at the stratified Windmiller mound (CA-SAC-107), suggested three temporally distinct cultural traditions: Early, Transitional, and Late. Information grew as a result of excavations at other mounds in the delta and lower Sacramento Valley by Sacramento Junior College and the University of California, Berkeley.

Previous investigations in the project region have focused upon very detailed archival research of Spanish sources (Bennyhoff 1977), reexamination of earlier work (Ragir 1972; Schulz 1981; Doran 1980) and archeological investigations at a number of small sites (Schulz et al. 1979; Schulz and Simons 1973; Soule 1976). Several of the previously investigated sites probably represent satellite encampments or small villages associated with major villages. The majority of the sites appear to be relatively late in time, and probably represent Plains Miwok. The activities practiced are varied, but detailed studies on the faunal collection suggest seasonality of occupation and a focus on fish species other than the main channel varieties.

Writing the definitive summary of California archeology, Moratto (1984: 529-547) devoted an entire chapter to linguistic prehistory. For the Central Valley region, Moratto points out that some Early Horizon and Middle Horizon central California archeological sites appear at least in part, contemporaneous, based on existing radiocarbon dates. Cultural materials recovered from CA-SJO-68, an Early Horizon site, are thought to relate to date to 4350 ± 250 B.P or 2350 B.C. On the other hand, a Middle Horizon component at CA-CCO-308 dates to 4450 ± 400 B.P. or 2450 B.C. The antiquity of other Early and Middle Horizon sites demonstrate an overlap of the two horizons by a millennium or more.

One explanation proposes that the Middle Horizon represents an intrusion of ancestral Miwok speaking people into the lower Cosumnes, Mokelumne, and Sacramento River areas from the Bay Area. The Early Horizon may represent older Yokuts settlements or perhaps the speakers of a Utian language who were somehow replaced by a shift of population(s) from the bay.

Ethnological Background

The project area lies in the territory attributed to the Nisenan, a branch of the Maidu group of the Penutian language family. Tribes of this language family dominated the Central Valley, San Francisco Bay areas, and western Sierra Nevada foothills at the coming of the white man. The Nisenan controlled the drainages of the Yuba, Bear, and American rivers, along with the lower portion of the Feather River. The tribes of this whole region referred to themselves as Nisenan, meaning "people," in contrast to the surrounding tribes, in spite of close linguistic and cultural

similarities. For this reason, they are usually named by this term rather than the more technical "Southern Maidu." In any event, the local main village was of more importance to the people than the tribal designation, and groups identified themselves by the name of the central village.

Their northern boundary has not been clearly established due to similarity in language to neighboring groups. The eastern boundary was the crest of the Sierra Nevada mountains. Probably a few miles south to the confluence of the American and Sacramento rivers on the valley floor was their southern boundary. The western boundary extended from this point upstream to the mouth of the Feather River.

The Valley Maidu settlement pattern was basically oriented to major river drainages, with ancillary villages located on tributary streams and sloughs. Major villages often supported a population exceeding five hundred people (Wilson and Towne 1978:389). The flat grasslands between water courses were used for collecting vegetable foods and hunting, but these activities leave little, if any, archeological evidence.

Both the valley and foothill Nisenan lived by hunting and gathering, with the latter being more important. Acorns in the forms of meal, soup or bread provided the staple diet, augmented by a wide variety of seeds and tubers. Hunting and fishing were regularly practiced, but provided less of the diet than vegetable foods. The bedrock mortar and pestle were employed to process the acorn meats into flour, and the mortar cups are frequently found throughout the range of oak trees. Both salmon and eel were caught at Salmon Falls near Folsom.

Religion was in the form of the "Kuksu Cult," a widespread pattern among the California Indians. Ceremonies congregated in the semi-subterranean dancehouse located at the central village and "cry sites" where the annual mourning ceremony for the dead took place. Later, the religious revival of the ghost dance also affected this area.

In 1833, the great epidemic swept through the Sacramento Valley. This epidemic has been attributed to malaria (Cook 1955:308), and is estimated to have killed seventy-five percent of the native population, leaving only a shadow of the original Maidu to face the intruding miners and settlers. The Nisenan of the mountain areas felt little of the impact of European settlement in California as compared to the Valley Nisenan, who were subjected to some missionization. The Mountain Nisenan, remote from these early impacts, were overwhelmed by the gold rush. Native ways of life were almost totally abandoned, and today only a few families in Placer, Nevada, Yuba, and El Dorado counties identify themselves as Nisenan and can speak the language (Wilson and Towne 1978).

Historical Context

The project area lies just south of the southern boundary of the Rancho Rio de los Americanos, a grant of over 35,500 acres on the south side of the American River, made to William Leidesdorff by the Mexican governor. Leidesdorff died in San Francisco in 1848, and Joseph L.

Folsom, who had come to California as assistant quartermaster of Stevenson's New York Volunteers, purchased the estate from the heirs at a low price, becoming one of the wealthiest men in California. The town of Folsom was laid out on the rancho in 1855 as the terminus of the Sacramento Valley Railroad, and named in his honor (Hoover, Rensch and Rensch 1970:300).

The project area lies near the route of White Rock Road, an important early route into El Dorado County and the mining region. It was first used in 1848, connecting Sacramento to Placerville. A number of inns grew up along this road to provide food and lodging to the drivers of the slow-moving freight wagons that used this roadway, carrying supplies to the mining towns. The discovery of the Comstock lode in Nevada in the 1860s brought increased traffic on this road. The completion of the Central Pacific in 1869 brought an end to the era of heavy freight hauling, with goods more efficiently shipped via rail from Sacramento to Nevada, or directly from the East.

The agricultural value of the land was soon recognized, and the lands of the area claimed for use by permanent settlers. The lands of the project area were of limited agricultural value, used for seasonal grazing or for the cultivation of grain. In many areas, small land tracts were originally claimed by a number of individuals who attempted to make a living by farming and ranching. It was soon discovered that the long dry period between May and October with no rainfall caused the grasses to dry off, leaving the land useless for grazing livestock except in the winter and spring. Cattle and sheep ranchers were forced to move their herds to the mountains to a summer range. This was not cost-efficient except for landowners who had large tracts of land at the lower elevations to support large herds that could be moved seasonally. As a result, many sold their small tracts to their neighbors and moved on to other pursuits, with some families amassing thousands of acres in the region for their cattle and sheep.

One of the later uses for land in the region was for mining with dredgers. To the north of the project area, the Natomas Company acquired much of the land from the early ranchers. The proximity of water made this property viable for dredging, although it is at the edge of what could be dredged due to the topography.

A description of the dredging process follows:

> A bucket-line dredge floats in a pond which moves along with the dredge. The gravel is constantly excavated by the endless chain of moving buckets. Digging is started at the top of the bank and as the bucket-line moves upward, the dredge swings to the left and right, pivoting about the spud, a heavy pole at the stern with its point imbedded in the rock tailings. The side swinging is accomplished by the port and starboard bow lines which are carried from the underwater end of the digging ladder to the shore blocks and back to the bow fair-leads on the forward deck, thence to the swing winch, usually mounted inside the deck house on the starboard side.

> The buckets elevate the material to a main hopper ahead of a revolving trommel. The gravel is washed and classified in the trommel. Trommel oversize or tailings are discharged to a rubber conveyor belt or so-called stacker belt where the material is stacked astern of the dredge as large tailing piles. The tailings left by bucket-line dredges consist of huge furrow-like ridges of gravels, cobbles and small boulders which are 50 feet or more above the adjacent land surface (Carlson 1955:136).

On-site dredging reportedly occurred between 1915 and 1962 to the north of the project area. The average depth of dredging at the site is reported to have been between 80 and 110 feet.

Beginning in 1950, the Natomas Company sold off large tracts of dredged-over lands to Aerojet General Corporation (AGC) to be used in part of the development and testing of missile propulsion systems. The project area was sold to AGC in 1956. By the mid-1950s, Aerojet held over 18,000 acres. The vast acreage of dredge tailings, available at a low cost, provided Aerojet insulation from those who might be disturbed by the noise, at a location in fairly close proximity to housing for a large work force (Lindström and Wells 1989:32).

Between 1956 and 1961, about 1,700 acres of the site were leased to McDonnell Douglas Corporation (MDC). MDC constructed test stands, buildings, and various facilities into the Administration, Alpha, and DM-14 areas. In 1961, MDC purchased the 4,000 acre property from AGC to establish the site as a static rocket test facility. MDC divided the property in nine areas, seven of which were developed into test and assembly facilities. The developed areas were designated: Alpha Complex, Beta Complex, Kappa Complex, Gamma Complex, Sigma Complex, DM-14 Area and the Administration and Support Area. The two undeveloped areas include the proposed Delta Complex in the northwest quadrant of the site, and an unassigned area for future expansion along the eastern edge of the property. MDC used the site for the assembly and testing of rocket systems through 1969, when the last static test firing occurred.

Between 1962 and 1972, certain parcels of the site were leased to the National Aeronautics and Space Administration (NASA). The site was maintained in a state of readiness for the NASA program between 1969 and 1972. The site was deactivated between 1972 and 1977, with the metal portions of the test stands demolished and dismantled for scrap. In 1977, the Administration Area was converted to an industrial park. MDC divided the area into numerous parcels offered for sale or lease. AGC reacquired the project area in 1984, with the exception of some of the parcels in the Security Park. The CDC Cattle Company has used much of the site for grazing since 1971 (ENSR Consulting and Engineering 1993).

Site Specific Historical Context

George Frederick Jaeger was born in Germany in October 1840. His family immigrated to the United States in 1845. In the 1860 Federal Census (taken in June), there are two 19-year-old men named George Jaeger born in Germany and residing in the United States with their parents—one in Missouri and one in Wisconsin. The George Jaeger who purchases land in the

study area is undoubtedly one of these individuals, but without extensive research, it is not possible to tell which one is the correct individual.

The first record of George Jaeger in California is in 1875, when he marries Emma Henrietta Reese in El Dorado County (El Dorado County marriages). Emma Reese was born in California in 1857, with parents Henry and Henrietta Reese born in Prussia and Germany (Federal Census 1870). Her father worked as a miner in 1870, and the family lived in the Placerville Township.

On January 1, 1879, their first daughter was born at Reservoir Hill in El Dorado County (*Mountain Democrat*, 1-11-1879). In the 1880 Federal Census, George Jaeger is listed in El Dorado County in the Placerville Township as a 38-year-old miner, with his wife Emma, 23, and their one-year-old daughter, Etta.

In 1880, George Jaeger purchased lands including the study area, apparently deciding to switch his occupation to ranching and farming. Louis Lepetit was shown in the County tax assessment roll as the owner of several tracts of land in the County, including all of section 16 and the fractional south half of section 9 (Township 8 North Range 7 East). The only improvement listed is $20 on the property in section 9, likely for fencing. Jaeger paid the second tax installment in November 1880, suggesting his purchase of the property between April an November of 1880.

By 1885, Jaeger was listed as the owner of the 850-acre tract, valued at $12,750. He had a house and fences worth $1,250. Other property included furniture valued at $100, an organ at $50, farming tools ($50), machinery ($100), wagons worth $150; harnesses worth $25, 4 horses and 4 colts valued at $550, 10 cows worth $300, 15 head of cattle, poultry and $400 in wheat.

In 1887, twin girls were born to the family: Maybel and Myrtle. The 1888-1889 County Directory listed Jaeger in the community of Cosumne, apparently his post office at the time. By 1890, Jaeger had continued to prosper. He had improvements valued at $1,000, with personal property of $1,925, including $250 in monies loaned to others, calves, cattle, colts, cows, farm tools, furniture, wheat, harnesses, horses, and wagons. In the 1891-1892 County Directory, his residence is listed as "four miles north" of Cosumne.

In 1892, the Sacramento County Great Register of Voters provided a physical description of Jaeger: 5' 9" in height, with light hair and complexion with blue eyes. He was then listed at Michigan Bar, apparently the closest precinct at the time. He was reported to be a naturalized citizen by virtue of his father's naturalization.

In 1900, the family was listed on the ranch in Lee Township. George and Emma Jaeger lived with their three daughters: Etta, a 21-year-old bookkeeper at a drugstore; and 12-year-old twins, Maybel and Myrtle.

Jaeger apparently raised hay and grain on his land, as well as some livestock. His hers was too small for him to have moved it annually to land at higher elevations when it dried out after the spring rains ended. He must have irrigated a portion of his lands as pasture for the livestock.

Jaeger's home appears to have been located in section 9. Jaeger may have also had some difficulty in sustaining operations at the ranch, as the involvement of his daughters in ranch activities would have been limited due to the attitudes toward the role of women at this time.

George Jaeger apparently moved his family in to the City of Sacramento in about 1905 or 1906 as he is listed in the 1904 Great Register of Voters at Sloughhouse, apparently on his ranch until 1904. George may have been in ill health, or may have wished to retire from farming with increasing age. He purchased a home at 1523 F Street.

Jaeger died on February 14, 1907 at age 66. The family had a visitation at their home on the 16th, with a private funeral. No other detail on his life was provided in the obituaries (*Sacramento Union* 2-16-1907).

In his will, Jaeger left three-fifths of his estate to his wife, with the remaining two-fifths to be shred by his three daughters. The will was signed on February 9, 1907, five days before his death. In early 1908, Emma Jaeger filed a final account for the estate. Jaeger owned four houses in the City of Sacramento, a 414-acre ranch in the Florin area, a 200-acre ranch as well as the 850-acre main ranch. He had sold his 480-acre holdings in El Dorado County to Alex F. Forni. The total value of the estate was over $37,000.

Apparently, two of the houses in Sacramento were rental properties. The ranch was apparently rented the ranch to the Little Brothers. Income was received for hay sold. Sacramento County maps continue to show the study area as owned by the George F. Jaeger estate through at least 1923. The 1920 Federal Census indicates that Mrs. Jaeger lived with her unmarried daughter Myrtle on 27th Street in the City of Sacramento, with their occupation listed as "none", suggesting they continued to receive income from the ranch property.

RESEARCH

A records search was conducted for the project area at the North Central Information Center of the California Historical Resources Information System in November 2004. No sites have been identified in or adjacent to the project area. CA-SAC-308H has been used to record all of the mining tailings and features of the American River Mining District, and it is assumed that the nearby dredger tailings are considered part of that "site."

NATIVE AMERICAN CONSULTATION

A letter was sent to the Native American Heritage Commission (NAHC) requesting a check of the Sacred Lands files (Appendix 2). The check failed to reveal any properties listed as Sacred Lands. The NAHC did provide a list of individuals and groups to contact regarding the property.

Letters were sent to Leland Daniels; Glenn Villa Sr. and Pamela Baumgarter, of the Ione Band of Miwok Indians; Clifford McKean, Miwok Indian Community of the Wilton Rancheria; Dwight Dutschke, Sierra Native American Council; and Mary Daniels-Tarango, Wilton Rancheria. No replies have been received to date.

FIELD ASSESSMENT

Ann Peak (resume, Appendix 1), assisted by Sue Merritt (graduate student in Anthropology, CSU Sacramento) and Leland Daniels (archeological technician of Miwok descent), completed a field survey of the project site in December 2004, with a complete inspection of the proposed project site. Ground visibility was fair to good. Based on the results of this inspection, it can be confirmed that there are no prehistoric nor historic period resources located within the project area.

EFFECTS OF THE PROPOSED PROJECT

As a result of the identification and evaluation efforts, an agency official may find that there are no historic properties present or there are historic properties present but the undertaking will have no effect upon them as defined in Section 800.16 (i).

If the agency official finds there are historic properties which may be affected by the undertaking, the agency official shall apply the criteria of adverse effect. "An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling or association" (Section 800.5 (a)).

There are three possible findings:

- **Finding of no historic properties affected:** There is no effect of any kind on the historic properties.
- **Finding of no adverse effect:** There could be an effect, but the effect would not be harmful to the characteristics that qualify the property for inclusion in the National Register; or
- **Adverse effect:** There could be an effect, and that effect could diminish the integrity of such characteristics.

There were no historic properties recorded within the project area. With regard to Section 106 of the NHPA, it is recommended that agency seek concurrence from the California SHPO with a finding of "no historic properties affected" per § 800.4(d) (1).

PROFESSIONAL EXPERIENCE

Ms. Peak has served as the principal investigator on a wide range of prehistoric and historic excavations throughout California. She has directed laboratory analyses of archeological materials, including the historic period. She has also conducted a wide variety of cultural resource assessments in California, including documentary research, field survey and report preparation.

In addition, Ms. Peak has developed a second field of expertise in applied history, specializing in site specific research. She is a registered professional historian and has completed a number of historical research projects. Ms. Peak has been a regular lecturer for courses in the Capital Campus Public History program (California State University, Sacramento), teaching cultural resource law and site specific research methods.

Through her education and experience, Ms. Peak meets the Secretary of Interior Standards for historian, architectural historian, prehistoric archeologist and historic archeologist.

EDUCATION

M.A. - History - California State University, Sacramento, 1989
Thesis: *The Bellevue Mine: A Historical Resources Management Site Study in Plumas and Sierra Counties, California*
B.A. - Anthropology - University of California, Berkeley, 1976

RECENT PROJECTS

In recent months, Ms. Peak has completed several determination of eligibility and effect documents in coordination with the Corps of Engineers for projects requiring federal permits, assessing the eligibility of a number of sites for the National Register of Historic Places. She has also completed historical research projects on a wide variety of topics for a number of projects including the development of navigation and landings on the Napa River, a farmhouse dating to

the 1860s, an early roadhouse, and a section of an electric railway line. She also completed an NRHP evaluation of Folsom Dam for the Corps of Engineers.

In recent years, Ms. Peak has prepared a number of cultural resource overviews and predictive models for blocks of land proposed for future development for general and specific plans. She has been able to direct a number of surveys of these areas, allowing the model to be tested.

She served as principal investigator for the multi-phase Twelve Bridges Golf Club project in Placer County. She served as liaison with the various agencies, helped prepare the historic properties treatment plan, managed the various phases of test and data recovery excavations, and completed the final report on the analysis of the test phase excavations of a number of prehistoric sites. She is currently involved as the principal investigator for the Clover Valley Lakes project adjacent to Twelve Bridges in the City of Rocklin, coordinating contacts with Native Americans, the Corps of Engineers and the Office of Historic Preservation.

Ms. Peak has served as project manager for a number of major survey and excavation projects in recent years, including the many surveys and site definition excavations for the 172-mile-long Pacific Pipeline proposed for construction in Santa Barbara, Ventura and Los Angeles counties. She also completed an archival study in the City of Los Angeles for the project. She also served as principal investigator for the 1997 coaxial cable removal project for AT&T.

Additionally, she completed a number of small surveys, served as a construction monitor at several urban sites, and directed the excavations of several historic complexes in Sacramento, Placer and El Dorado Counties.

Ms. Peak is the author of a chapter and two sections of the recently published history (1999) of Sacramento County, *Sacramento: Gold Rush Legacy, Metropolitan Legacy*. She is currently preparing text for the second Sacramento County history volume, to be published by Heritage Media in 2005.

RESUME

ANN S. PEAK **February 2004**
Consulting Archeologist

PROFESSIONAL EXPERIENCE

Ms. Peak has had over thirty years of extensive experience in both the public and private sectors, in providing professional archeological services. She has completed archeological work in all cultural areas of California, western Great Basin, and southeastern Oregon. Her projects include contracts with federal, state and local agencies and private firms.

She has directed all types of cultural resource-related projects, including field surveys, test excavations, data recovery programs, intensive archival research and cultural resource management.

EDUCATION

M.A. - Anthropology - California State University, Sacramento, 1975
B.A. - Anthropology - California State University, Sacramento, 1972
Studies in public health and microbiology, University of California, Berkeley, 1949-1950

RECENT PROJECTS

Ms. Peak most recently served as principal investigator for the data excavations at CA-PLA-592, -613, -618, -619, and -620, prehistoric midden sites in the Sierran foothills. In 1993, she served as the principal investigator for the excavations at CA-PLU-88, a large seasonal camp site with prehistoric rock art in the Plumas National Forest. She also completed the recordation and analysis of the numerous petroglyphs present within a portion of the site

Ms. Peak served as the principal investigator for the various surveys and site testing for the 172-mile-long Pacific Pipeline project proposed for construction in Santa Barbara, Ventura and Los Angeles counties. She has completed a number of smaller surveys throughout northern California and Nevada.

Ms. Peak has extensive experience in Great Basin culture areas, directing a number of large block surveys for proposed new mines or re-operations of historic mine sites throughout Nevada. She has served as principal or field director and co-author on other large projects completed in recent years, including excavations of two historic sites in Sacramento County and one in El Dorado County, several prehistoric sites within the proposed Haystack Reservoir in Merced County and a prehistoric site within the area of the proposed Susanville Correctional Center expansion.

RE: Proposed Sunrise-Douglas Planned Community, Sacramento County; Riverview subdivision, Sacramento County and Boessow subdivision, Sacramento County

Dear Mr. Gerry:

A record search of the sacred land file has failed to indicate the presence of Native American cultural resources in the immediate project area. The absence of specific site information in the sacred lands file does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Enclosed is a list of Native Americans individuals/organizations who may have knowledge of cultural resources in the project area. The Commission makes no recommendation or preference of a single individual, or group over another. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated, if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe or group. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact me at (916) 653-4038.

Sincerely,

Debbie Pilas-Treadway
Environmental Specialist III

PEAK & ASSOCIATES, INC.
CONSULTING ARCHEOLOGY
Twenty-firth Anniversary: 11/26/00

October 29, 2004

Ms. Debbie Pilas-Treadway
Native American Heritage Commission
915 Capitol Mall, Room 288
Sacramento, CA 95814

Dear Ms. Pilas-Treadway:

Peak & Associates, Inc. has contracted with Foothill Associates, Inc., to perform a cultural resources assessment of parts of the Sunrise-Douglas Planned Community in Sacramento County. The overall project area, including planned improvements of Sunrise Boulevard, is depicted on the enclosed maps. We have performed surveys of parts of this area several years ago. We are now contracted to complete the coverage. Since the older surveys were conducted before Native American consultation was commonplace, we wish to request information on the entire project area. The project lies in Sections 7 - 10,15 - 17 and 20 of T8N, R7E. Portions of the Sunrise Boulevard part of the project area are in T9N, R7E (no sections – Rio de los Americanos grant.) The project is mapped on the Buffalo Creek and Carmichael (Sunrise Boulevard) 7.5' USGS quadrangles, which are the base for the attached maps.

Because of wetland issues, and transportation funding, this is a federal undertaking. In accordance with the Secretary of the Interior's Guidelines for implementing Section 106, we are requesting a list of appropriate Native American contacts for the project area. We also request a check of the Sacred Lands Inventory for any potential conflicts.

Thank you for your assistance.

Sincerely,

Robert A. Gerry
Consulting Archeologist

Management Summary

The Ranch is a proposed 530-acre mixed use community in the south portion of the City of Rancho Cordova, Sacramento County, California. The Ranch lies on the east side of Jaeger Road, south of Douglas Road, one mile east of Sunrise Boulevard and one mile west of Grant Line Road.

As a Clean Water Act, Section 404 permit is required for the undertaking, the U.S. Army Corps of Engineers must initiate a National Historic Preservation Act, Section 106 consultation in an effort to avoid harm to any historic properties listed in or eligible for the National Register of Historic Places.. Twelve years have elapsed since the previous cultural resources inventory and evaluation. To conform with current Corps requirements, an updated records search, current Native American and historical society contacts, field work to document current conditions and an updated, stand-alone technical report are required.

In an updated effort to identify historic properties listed on or eligible for the National Register, the present study included an updated records search by the North Central Information Center, California Historical Resources Information System, a review of recent satellite images of the project area, a review of previous studies in the project vicinity, an updated sacred lands file search by the Native American Heritage Commission, contact with tribes listed by the commission, contact with historical societies, on-line searches and a field survey along widely spaced transects to evaluate the adequacy of the previous study. In addition, an architectural historian who meets the Secretary of the Interior's professional qualifications standards assessed the National Register eligibility of the high voltage electrical transmission towers and lines that now may meet the 50 year threshold for eligibility.

As a result of these efforts, only one cultural resource was identified during the study: the two parallel alignments of high voltage electrical transmission towers and lines located in The Ranch Area Potential Effects. Designated P-34-5210 by the North Central Information Center, the transmission towers and lines were assessed as not eligible for the National Register individually or as contributing resources of a historic district under any criterion of eligibility. The study concludes that no historic properties will be affected by the proposed undertaking.

Introduction

The Ranch is a proposed 530-acre mixed use community in the south portion of the City of Rancho Cordova, Sacramento County, California. The Ranch lies on the east side of Jaeger Road, south of Douglas Road, one mile east of Sunrise Boulevard and one mile west of Grant Line Road (see Figure 1, below).

In 2005, Peak & Associates, Inc. conducted a cultural resources inventory and evaluation of the "Jaeger 530," now known as, "The Ranch." The Peak & Associates study included a a records search at the North Central Information Center, detailed historic context based on archival research, a sacred lands file search by the Native American Heritage Commission, an attempt to contact Native Americans listed by the commission, and a field survey. The study concluded that no prehistoric or historic period resources were located within the project area.(Peak 2005b:12).

As a Clean Water Act, Section 404 permit is required for the undertaking, the U.S. Army Corps of Engineers will initiate a National Historic Preservation Act, Section 106 consultation. Twelve years have passed since the Peak & Associates study. To conform with current Corps requirements, an updated records search, updated Native American and historical society contacts and field work to document the current conditions were completed, the results of which follow in this stand-alone report.

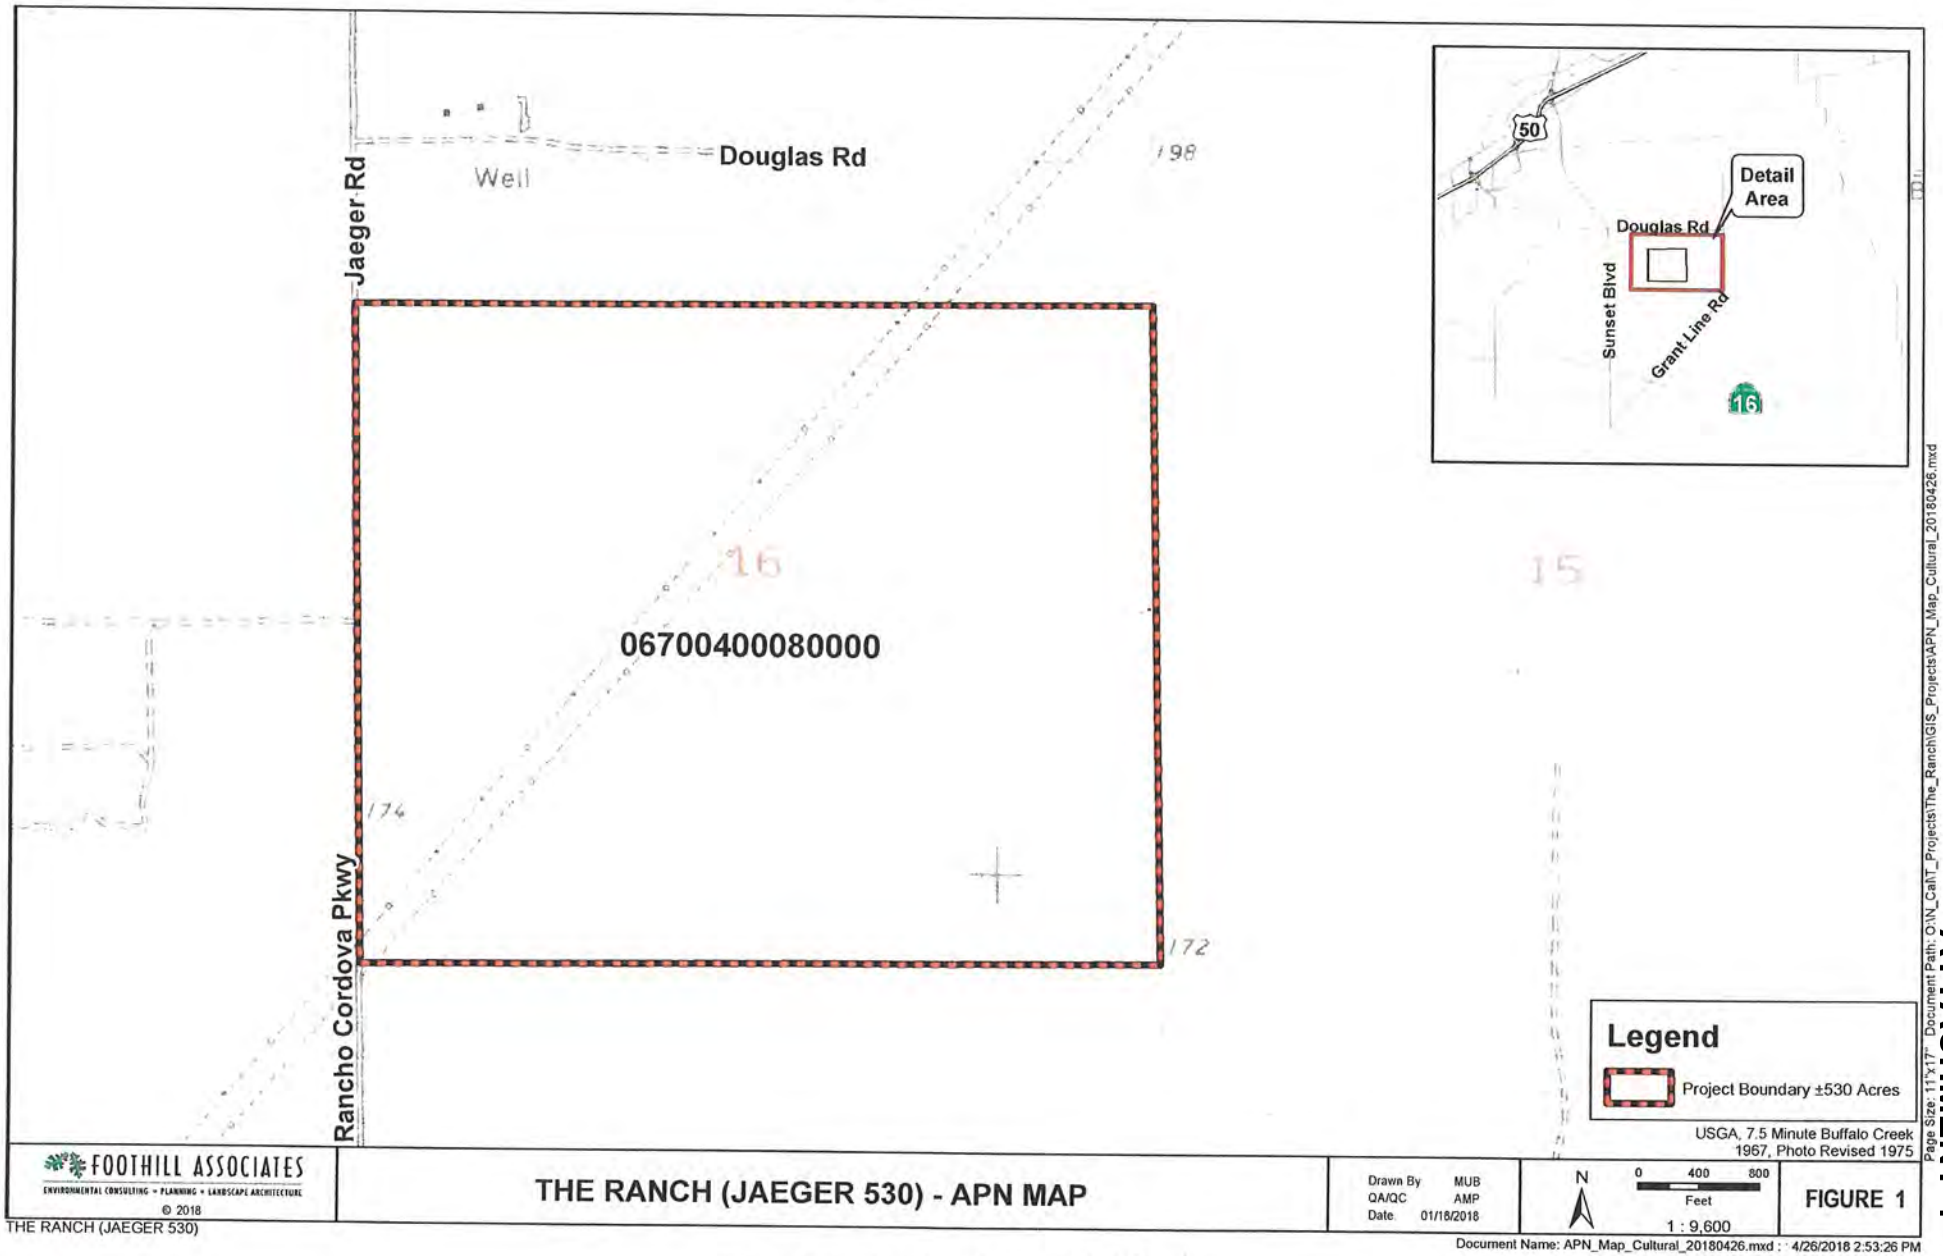
Project Description

The proposed project will be a mixed-use community in the City of Rancho Cordova consisting of low- to high-density residential development, neighborhood parks and mixed-use commercial development. In addition, the expansion of Chrysanthy Boulevard is a vital west-east connector street within the City of Rancho Cordova. Land uses proposed by The Ranch Project are consistent with the land use designations identified by the *Rancho Cordova General Plan*, under the land use authority of the City of Rancho Cordova. The project is located and configured to use infrastructure extensions of the Sunridge Specific Plan area, including sewer mains, sewer trunk lines, gas and electric mains and water mains.

The applicant proposes development of 1,266-1,300 units, including 642 gated single-family active adult units with a club house, and 634-658 conventional single-family units. In addition, six acres are dedicated for commercial use per the City of Rancho Cordova General Plan and five acres are currently reserved for multi-family residential (apartments) in accordance with the City of Rancho Cordova's Affordable Housing Plan. A network of bicycle and pedestrian trails (four acres) will be incorporated into the land plan and provide connectivity from existing Anatolia Bike Trail to the west and south to the proposed middle and high school campuses located directly south of the project site. A grade separated pedestrian/bicycle crossing (at Chrysanthy) is proposed within the PG&E easement.

In addition to development, the proposed project will preserve approximately 198 acres of the parcel in an on-site open space/wetland preserve that will be deeded to a third-party conservation entity to be maintained in perpetuity. The applicant will incorporate protections for the preservation of wetland resources within the preserve, including preserve fencing, long-term funding and management of the preserve in perpetuity and protection of the preserve from drainage and runoff generated from development areas through the construction of several proposed detention basins in the development.

Onsite infrastructure associated with the project will include the construction of internal access roads, the proposed alignment of Chrysanthy Boulevard bisecting the project site, connecting to the current termini of Chrysanthy Boulevard. In addition, Rancho Cordova Parkway will be widened to four lanes. The proposed



ATTACHMENT 4

Figure 1. Project location and vicinity.

North Campus Road located along the southern boundary will be constructed as required by the City of Rancho Cordova. The improvements will include outside lane, curb, gutter and detached sidewalk along the residential frontage.

A total of 21.53 acres of jurisdictional aquatic resources have been mapped within the project site including 2.92 acres of depressional seasonal wetlands, 15.04 acres of vernal pools, 1.66 acres of riverine seasonal wetlands, 0.06 acres of riverine seasonal wet swales, 1.54 acres of intermittent drainages, and 0.30 acres of drainage basin out-falls. The U.S. Army Corps of Engineers issued a Preliminary Jurisdictional Determination on October 14, 2014 concurring with the 21.53 acres of aquatic resources mapped with the project site.

As proposed, project development will result in the fill of 6.37 acres of aquatic resources including 1.056 acres of depressional seasonal wetlands, 4.752 acres of vernal pools, 0.507 acres of riverine seasonal wetlands, and 0.059 acres of riverine seasonal wet swales . A total of 0.01 acre of temporary impacts will occur associated with utility placement with a spanned crossing along Chrysanthy Boulevard.

Approximately 20,554 cubic yards of clean fill will be placed in 6.37 acres of waters of the U.S. in order to accommodate construction of the proposed development using various types of standard construction equipment, including scrapers, bulldozers, and excavators.

The Undertaking

Since the project would affect waters of the United States, the project proponent must meet requirements of Section 404 of the Clean Water Act and/or Section 10 of the Rivers and Harbors Act, and therefore, is seeking a permit from the U.S. Army Corps of Engineers, Sacramento District.

Area of Potential Effects

The geographic Area of Potential Effects (APE) for The Ranch is the entire 530 acres (see Figure 2,below).

The viewshed from the APE includes a recent residential subdivision immediately adjacent to the north side of the APE, a partially built-out residential subdivision along the west side of the APE, and agricultural grazing land on the south and east. A Pacific Gas & Electric Company/Sacramento Municipal Utilities District (SMUD) easement crosses the APE northeast to southwest (see Appendix A: Other Figures).

Maximum anticipated depth of excavation is 25 feet for sewer trenching. This maximum depth will be the vertical (depth) APE. Depth of excavation for water lines will be four feet below finished grade. Drainage will be 5-6 feet. The ponds will be 17, 8 and 13 feet in depth. The above ground vertical APE was not available. However, no historic properties whose eligibility for the National Register of Historic Places would be impaired by above-ground construction were identified within the geographic APE.

Literature Review

The literature review included an updated records search by the North Central Information Center, California Historical Resources Information System, review of published and unpublished literature in the Windmiler Consulting, Inc. library as well as on-line Internet research and contact with knowledgeable others..

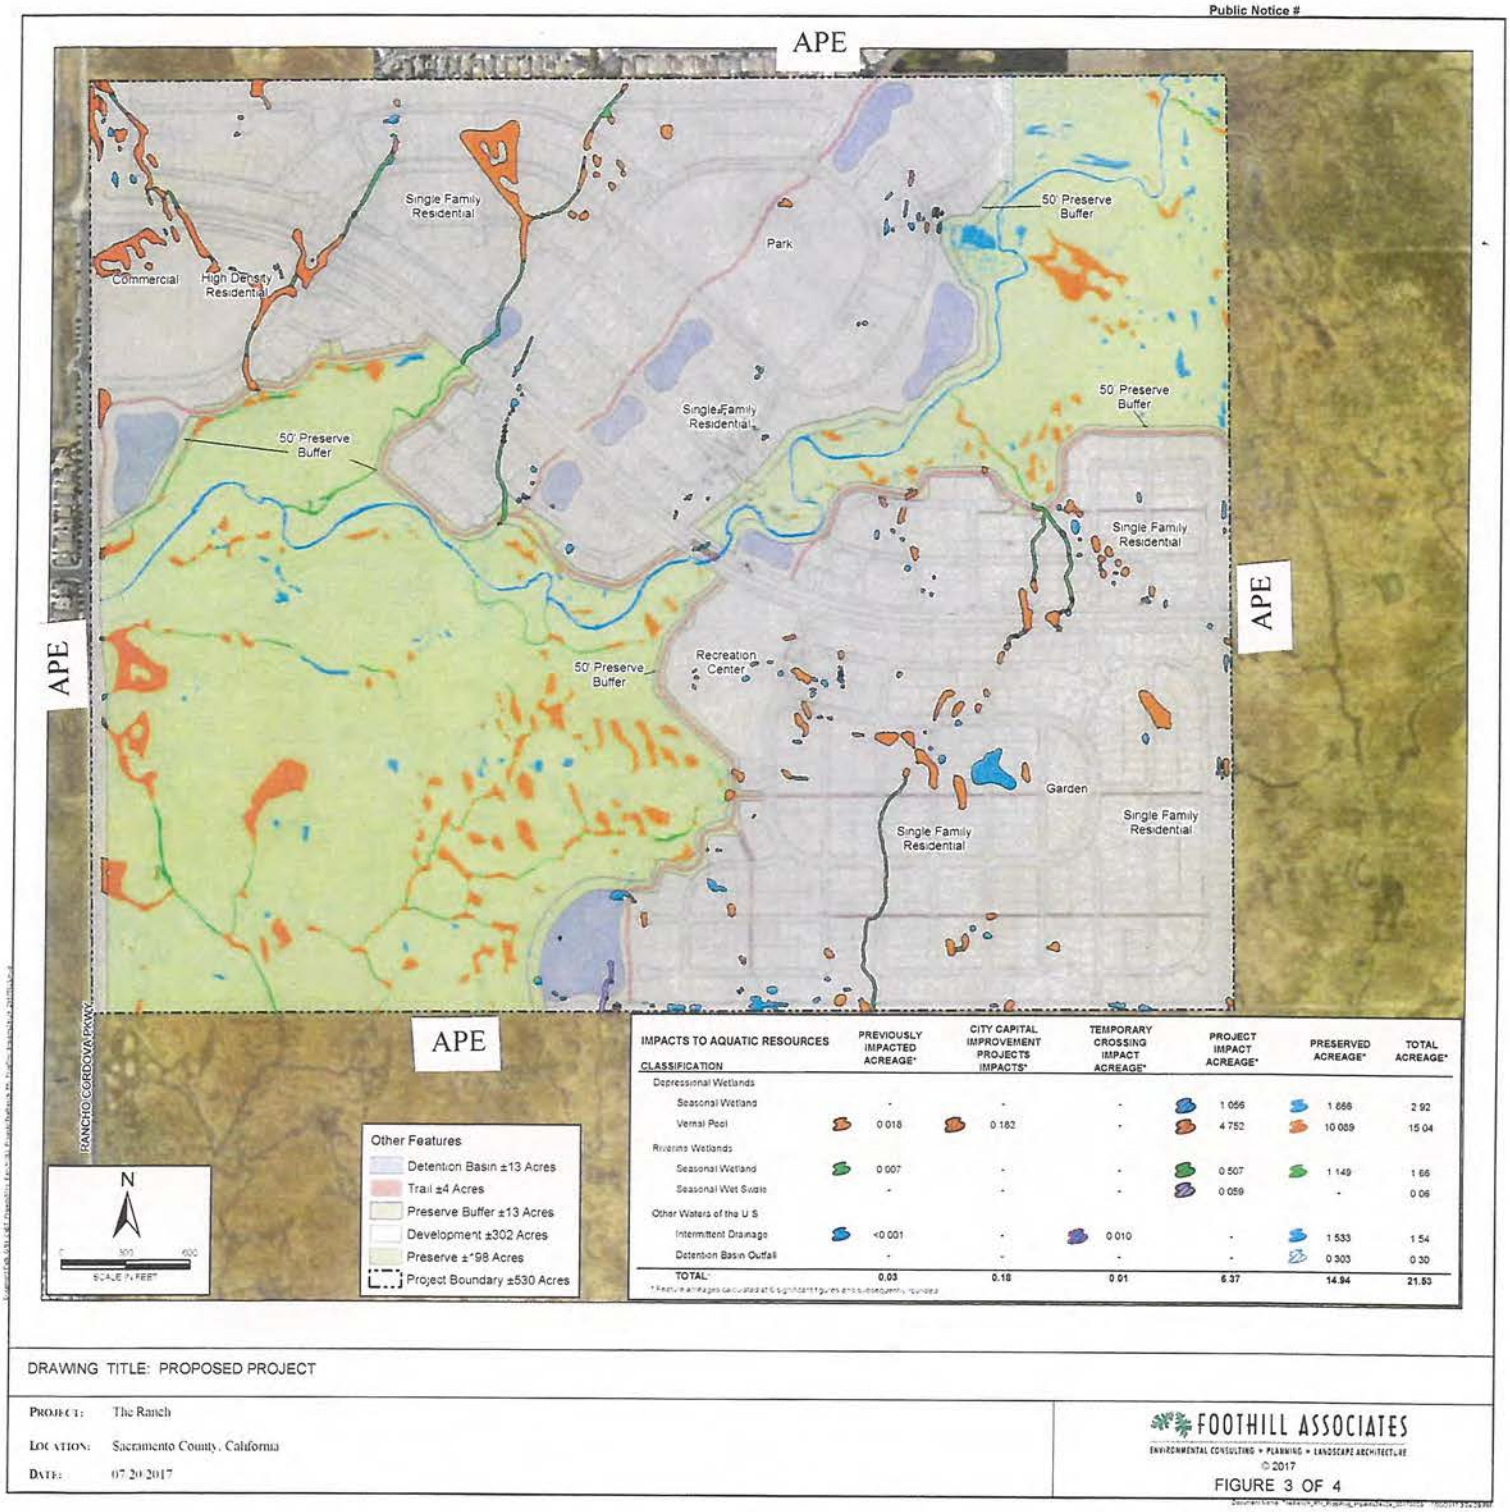


Figure 2. Area of Potential Effects (APE) with development plan and wetlands overlays.

Environment

The Ranch lies on treeless grassland near the eastern edge of the Sacramento Plains. Elevation of the APE varies between approximately 170 and 210 feet above mean sea level. The flat to hilly terrain is crossed northeast to southwest by a meandering seasonal drainage that joins the Morrison Creek drainage system several miles to the west. The Ranch is underlain with consolidated allluvial deposits of the Tertiary Laguna Formation; water worn gravel and cobbles are exposed in the shallow seasonal stream that crosses The Ranch northeast to southwest (Wagner *et al.* 1981).

The American River lies six miles to the north near Folsom. The Cosumnes River bends towards the Sierra foothills three miles to the southeast. The present climate is Mediterranean: summers are hot and rainless, while winters are cool, often with low (tule) fog and 6-20 inches rainfall (Storer and Usinger 1963:26).

Prehistory of the Sacramento Plains and North Delta Region, 10,000 B.C.-A.D. 1830

Three miles southeast of The Ranch lies the Cosumnes River drainage where archaeologists first began defining the culture sequence of Sacramento Valley human prehistory. The earliest evidence of Man along the Cosumnes drainage may be represented by the basal portion of a fluted obsidian Clovis-like projectile point found by the writer in the early1960s at the Windmiller Mound (CA-SAC-107).

In 1979, Peak and Associates began excavations at two ancient sites in the Calero Basin near Rancho Murieta, approximately nine miles east of The Ranch. Peak and Associates' archaeologist speculated that the Rancho Murieta sites, CA-SAC-370 and CA-SAC-379 date back to the late Pleistocene of 18,000 to 12,000 years before the present. However, it seems more likely that they belong to the later Western Pluvial Lakes Tradition. Both sites are stone quarry/workshop and possibly camp sites where native people fashioned chipped stone tools from the green chert bedrock and from water-worn cobbles of the Mehrten Formation (Peak 1981:70).

The Western Pluvial Lakes Tradition was an adaptation of ancient cultures to lake, marsh and grassland habitats along the eastern side of the Sierra Nevada as early as 11,000 years before the present (Moratto 1984:90-91). The development of the Western Pluvial Lakes Tradition and its regional variants may, as Moratto suggested, correspond to the emergence and initial differentiation of Hokan languages (1984:544).

The suspected antiquity of the Calero Basin sites created a large temporal gap between the earliest use of the Cosumnes drainage and the earliest sedentary occupation dating back to the Middle Archaic–a gap in prehistory of at least 5500 years about which practically nothing is known in this region of northern California.

The gap may be filled in part by finds such as the artifact-bearing layer exposed in the banks of Arcade Creek in North Sacramento. There, erosion exposed an artifact-bearing layer buried under nine feet of alluvium (Curtice 1961:20-25). Another example may be the Crevis Creek finds–chipped stone artifacts occurring in the gravels of Crevis Creek, eight miles east of The Ranch and close to the Calero Basin finds.

The type site for the Middle Archaic culture is located approximately 12 miles south southeast of The Ranch. Named the "Windmiller Mound" after the landowner, the site's antiquity spans approximately 4500-5500 years (*cf.* Heizer 1974:192-193 and Rosenthal *et al.* 2007:150). Like many other prehistoric archaeological sites of the lower Cosumnes bottomlands within the valley proper, the Windmiller Mound is situated on a natural clay knoll above seasonal flood waters.While Archaic period village sites and cemeteries of all ages are most common along the Cosumnes River (approximately six sites per linear mile), they do occur near other

water sources such as springs, seasonal tributaries and sloughs.

The natural drainage system of The Ranch locality transports water in a southwesterly direction ultimately to a series of lakes on the east side of the Sacramento River. The drainage system is known as the Morrison Creek Stream Group Basin. The lakes, Beach Lake and North and South Stone lakes were home to several historic groups of Miwok-speaking people whose villages were perched on natural clay knolls or natural river levees above seasonal flooding. In a four square mile area where Morrison Creek approaches the Sacramento River, archaeologists have identified eight such village mounds, each of which has probably been occupied at various times over a period of several thousand years.

In 1974, archaeologist Jerald J. Johnson conducted an archaeological field survey of the Morrison Creek Stream Group from the lakes along the Sacramento River to Mather Air Force Base, the east boundary of which lies one mile west of The Ranch (Johnson 1974).

By far the majority of Native American archaeological sites documented by Johnson were located around the lakes next to the Sacramento River far to the southwest of The Ranch (Johnson 1974:6 and maps).

Since Johnson's mid-1970s survey, archaeologists continued to survey large tracts of land on the Sacramento Plains between the American and Cosumnes rivers with few discoveries. A 1985 survey of Mather Air Force Base by the Archaeological Study Center, California State University, Sacramento, resulted in no finds (McIvers 1985).

A subsequent survey by EDAW, Inc. of 1041 acres resulted in no prehistoric archaeological finds (EDAW, Inc. 1991:13). In 2008, Sean Jensen conducted a survey at the edge of the Morrison Stream group, but found only six flakes of basalt and one flake of chert (Jensen 2008:10). Also in 2008, Far Western Anthropological Research Group conducted a survey along State Route 16, but found no prehistoric or historic Native American artifacts (Leach-Palm *et al.* 2008).

In 2009, Windmiller conducted a survey of 800 acres immediately north of State Route 16 and found no prehistoric or historic Native American archaeological resources (Windmiller and Osanna 2009:i).

The lack of reported surface finds in the region seems to reinforce the notion that the Sacramento Plains between the Cosumnes and American rivers was not a focus of Native American settlement or that archaeologists have not yet discovered the uses to which such lands were placed in prehistory.

From the larger regional perspective, linguists have long held that in early times, the northern part of the state was largely Hokan territory. Before 2000 B.C., speakers of Hokan languages left traces of their presence in early archaeological sites of the valley-foothills edge such as the stone tool quarry and campsites of the Calero Basin.

By 2500 B.C., however, Penutian-speaking peoples may have entered the lower Sacramento Valley. There is some empirical evidence to link the Middle Archaic Windmiller culture of the Cosumnes District to prehistoric cultures of the Great Basin and Plateau physiographic provinces. In his synthesis of California archaeology, Michael Moratto suggested that people of Penutian stock settled in the Stockton and Cosumnes districts. However, the languages spoken were not necessarily pre-Miwok or Costanoan. Soon after 2000 B.C., Moratto indicated that these Penutian language speakers expanded their sphere of influence westward to the East Bay where they came into contact with the older Hokan-speaking population (Moratto 1984:553).

Moratto suggested that there was a kind of fusion between the two language groups resulting in what is recognized in the archaeological record as the Berkeley Pattern. Moratto built a case for the entry of pre-

Yokutsan speakers into Central California after the proto-Miwok began to spread into the Bay Area. Moratto guessed that pre-Yokutsan people settled the delta and northern San Joaquin Valley between 1500 and 1000 B.C. Moratto further speculated that the pre-Yokutsan culture may have incorporated many traits of the Windmiller Pattern before settling the San Joaquin Valley and, by 500 B.C., the Central Sierra foothills (Moratto 1984:555).

The penetration of Wintuan-speaking people into northern California from Oregon 1100-1000 years ago coincided with the beginning of the Augustine Pattern in the Central Valley and use of the bow and arrow among the indigenous people (Moratto 1984:562-563).

While the Wintuan incursion appears to have caused the retreat of other peoples from the valley both eastward and westward, climate change also affected resident populations. Around A.D. 400 at the beginning of a warm and dry interval, Yokutsan-speaking people may have abandoned marginal areas in the valley and foothills and moved to more reliable water sources at higher elevations or along major streams and sloughs (Moratto 1984:564).

Between A.D. 1430 and 1850, relatively cool and moist conditions may have encouraged population growth in groups associated with the Augustine Pattern. Population shifts during this period resulted in the pattern of native settlements seen by early European explorers.

A recent updated synthesis of Central Valley archaeology notes little new information in areas such as the Cosumnes drainage due to few new investigations and the inadequacy of older collections in meeting the needs of current research objectives. However, researchers have taken the cultural periods, above, and updated the time span of each period based on new radiocarbon determinations adjusted with modern calibration curves (Rosenthal *et al.* 2007:150):

Paleo-Indian (11,550-8550 cal B.C.)
Lower Archaic (8550-5550 cal B.C.)
Middle Archaic (5550-550 cal B.C.)
Upper Archaic (550 cal B.C.-cal A.D. 1100)
Emergent (cal A.D. 1100-Historic)

With a long-standing focus on prehistoric cultures, archaeologists largely ignored Native American settlements of the historic period. The exception was James A. Bennyhoff and his doctoral dissertation, *Ethnogeography of the Plains Miwok*. Using the results of earlier archaeological excavations, historical documents and revisiting the archaeological sites himself, Bennyhoff succeeded in linking historic events to specific Indian village sites and defined the physical territories within which the incipient chiefdoms or "tribelets" of the historic Miwok Indians lived, hunted, fished and gathered (Bennyhoff 1977).

Ethnography/Ethnohistory of the Sacramento Plains-North Cosumnes, 1806-1912

The Ranch lies almost midway between the former homeland of the Maiduan speaking Nisenan along the American River and the *Amuchamne* tribelet of Miwok speakers along the Cosumnes River (Bennyhoff 1977:47, Map 2). The Ranch is probably more within the former range of the northern Cosumnes tribelet than the Nisenan of the American River.

The Plains Miwok were recognized as a distinct language group as early as 1806 when Spanish explorers first entered the region (Bennyhoff 1977:1). The term, "Miwok" is the word for "person" in Northern Miwok as reported by Powers in his 1877 work on California Indians (Powers 1877:347 quoted in Bennyhoff 1977:53).

It is important to understand that according to historical and ethnographic accounts, Miwok-speaking people did not recognize a "Plains Miwok Society." The largest sociopolitical group was the "tribelet."

In his early, definitive ethnographic work on California Indians, anthropologist Alfred Kroeber asserted that most northern California groups did not have true tribes, rather the distinction was between village communities or "tribelets." The term, "village community" implied a tract of land rather than a settlement. Generally, the population of a village community was divided between several settlements, each consisting of a few households. The principal village was maintained on a permanent basis, while subsidiary hamlets were frequently abandoned, re-occupied or newly founded (Kroeber 1925:831).

On a day to day basis, the lineage was the most important political and economic unit. Lineages consisted of men related through the male line of descent, their wives and children. Miwok lineages were associated with a specific place (locality) such as a tribelet's permanent settlements.

Miwok-speaking people were hunter-fisher-gatherers. Large game hunted by the native people included deer, antelope and tule elk. Gathering of wild plant foods varied with the seasons. Greens were gathered in the spring, while seeds were harvested from May through August. The major staple, acorns, were gathered in the fall. While the Miwok were not agriculturalists nor practiced in animal husbandry, they did cultivate tobacco to a limited extent and they kept dogs (Levy 1978:403).

Housing included pole and thatch structures, semisubterranean earth-covered lodges, a sweathouse built over a pit, menstrual hut and acorn granaries.

Each tribelet was named after its principal settlement. The principal settlement usually included an assembly house, often a large, circular semi-subterranean, earth-covered lodge. The assembly house was the location for all important religious ceremonies and major social events (Levy 1978:410).

The *Amuchamne* tribelet was the northernmost tribelet on the Cosumnes River drainage within the boundaries of the Sacramento Valley. Bennyhoff reported that the Sheldon map of 1847 illustrated the tribelet center a short distance south of Sloughhouse at a sharp bend in the river. CA-SAC-126 was tentatively identified by Bennyhoff as the tribelet center. While glass beads found at the site date only to the Mission Period, the existing artifact collection was incomplete and Bennyhoff's test excavations may have missed the historic cemetery that would have confirmed Sutter period use of the site (Bennyhoff 1977:105).

Historical documents indicate that *Amuchamne* was a major Plains Miwok tribelet, second only to *Cosumne.* Bennyhoff suggested that *Amuchamne* may have been the leading group of cooperating tribelets that resisted foreign contacts. Missionization of the *Amuchamne* people began in 1834-1835. However, only seven baptisms were recorded at that time. The population of the *Amuchamne* was depleted by the 1833 epidemic, which may in addition to resistence account for the low number of subsequent baptisms (Bennyhoff 1977:103-104).

By 1847, the *Shalachmushumne* may have moved upstream to the *Amuchamne* village to strengthen resistence to Nisenan intrusion into Miwok territory, which was driven by Sutter's desire for empire and Sheldon's use of Nisenan Indian labor on his ranch.

Amuchamne was the only organized Cosumnes River Miwok village to survive the gold rush. Sheldon's brother-in-law and partner, William Daylor, and Daylor's partner in a store and ferry on the Cosumnes and the road to the Southern Mines, William Grimshaw, traded with the Indians living in *rancherias* on Sheldon's *Rancho Omochumnes*. According to *Grimshaw's Narrative*, after Daylor died of Cholera in October, 1850, the few remaining Indians left their villages and never returned (Kantor 1964:25).

According to Bennyhoff, sometime between 1850 and 1870, the people of *Amuchamne* moved their village to the outskirts of Elk Grove. By 1870, the native people had built a dance house at the Elk Grove village, which became a principal dance center for the Plains Miwok. The *Amuchamne* exchanged dances with Nisenan villages near Sacramento (Bennyhoff 1977: 106). The Elk Grove dance house may have been the large circular dance house floor accidentally discovered at CA-SAC-134 during some agricultural grading 30-40 years ago.

We do not know precisely where the *Amuchamne* village was at Elk Grove. By 1890, *Amuchamne* descendants were apparently leaving the village to take jobs as farm laborers. In1912, avocational archaeologist Elmer Dawson removed six burials from CA-SAC-1, a shallow midden located three miles southeast of Elk Grove. Bennyhoff concluded that the graves dated to "the full American period" and were probably part of a cemetery used by the *Amuchamne* village at Elk Grove (Bennyhoff 1977:106-107).

History of Lee Township Border Area, 1840-1967

The Ranch lies on the Sacramento Plains in Lee Township. Two Mexican land grants took up portions of Lee Township between the Cosumnes River on the southeast and Folsom on the north. Sheldon's grant took up land on the west side of the Cosumnes River. Leidesdorf's grant took up land immediately north of The Ranch and extended to the American River (Reed 1923:121).

Other than early Spanish expeditions, most of which were launched to recruit neophytes for the missions, one of the earliest Europeans to cross the vicinity of The Ranch was William Daylor. History recounts the adventure of Daylor, who, one summer evening in 1840, rode to the top of a hill overlooking the Cosumnes River in search of Sutter's stray cattle. He found the verdant valley densely populated with Indians. Upon this observation, he returned to Sutter's Fort to report this finding to his friend, Jared Sheldon, who was also in Sutter's employ. Realizing the valley's agricultural potential, Sheldon and Daylor formed a partnership and secured a grant of the valley through their friend, E.P. Hartnell, who was Secretary of State and Interpreter for California's Mexican government (Reed 1923:121-122).

Daylor settled on the grant, while Sheldon bartered his labor for cattle from John Marsh of the present day Brentwood area. Daylor with the assistance of local Indians planted wheat. By 1847, Sheldon and Daylor constructed a dam and a grist mill on the Cosumnes. Upon the discovery of gold in 1848, Sheldon, Daylor and McCoon, along with a contingent of local Indians, established a mining camp at Webber Creek in the Placerville vicinity. By June that year, William Grimshaw partnered with Daylor and opened a store and Indian trading post at Daylor's ranch at Cosumne near present day Sloughhouse. The trading post was on the Jackson Road, which in those days was a wagon road from Sutter's Fort to the Southern Mines. Built on this historic route, Jackson Road (State Route 16) today lies 2.5 miles south of The Ranch.

Historian Melinda Peak traced the early ownership of The Ranch to Louis Lepetit, who owned several tracts of land including all of Section 16 (The Ranch) in Township 8 North, Range 7East. In 1880, George F.Jaeger purchased Section 16. The only improvements at that time appear to have been fencing (Peak 2005:10).

Jaeger was a native of Germany, born in 1840. His family immigrated to the United States in 1845. The first record of Jaeger in California is his marriage to Emma Henrietta Reese in 1875 in El Dorado County. The 1880 census listed George Jaeger as a 38 year old miner with his wife Emma, 23 and their one-year old daughter, Etta (Peak 2005:10).

The 1888-1889 County Directory listed Jaeger at Cosumne. The 1892 Register of Voters listed Jaeger at Michigan Bar. But, by 1900, the family was listed on the ranch in Lee Township. By this time, Etta was a 21

year old bookkeeper at a drugstore and she, along with Jaeger's 12-year old twin girls lived with George and his wife, Emma (Peak 2005:10).

The Jaeger family raised hay and livestock, although their operation apparently did not include seasonal driving of livestock to summer pastures in the Sierra Nevada, as was practiced by other ranching families in the region (*viz.*, Wilsons, Joergers, Fornis and Windmillers).

The 1910 Official Map of Sacramento County illustrates Section 16 as the Estate of George F. Jaeger. During his active years as a rancher, Jaeger's home appears to have been in Section 9, immediately north of Section 16. In 1905 or 1906, the family moved to 1523 F Street in Sacramento. George Fredrick Jaeger died in 1907 at the age of 66. A final accounting of his estate showed that Jaeger owned four houses in Sacramento, a 414-acre ranch in Florin, and another 200 acres in addition to his 850-acre main ranch. He had sold his El Dorado County land to Alex Forni, which brought his net worth to over $37,000. Section 16 remained as part of the estate until at least 1923 (Peak 2005:11).

The 1910 Official Map of Sacramento County shows that Jaeger's neighbors in the vicinity of Section 16 included Joseph Joerger, Katherin G. Sweet and W.F. Sperry (County of Sacramento 1910).

Another neighbor during the same period was the Natomas Company of California, which owned a checkerboard of properties in the township. The bank failures, collapse of mining ventures and failure of many new developing industries in the 1870s prompted the Natomas Company to shift to agricultural development. The Natomas Company became a major influence in converting depleted mining areas to industrialized viticulture and horticulture–the precursor along with the large scale California wheat growers to modern agribusiness.

Natomas Consolidated and its successor, Natomas Company of California continued dredging, whether for gold or farmland reclamation until gold mining was stopped by order of the War Production Board at the start of World War II. After the war, the dredging business never fully recovered. The last Natomas dredge ceased operations in 1962 (Castenada *et al.* 1984:7).

Crossing The Ranch project site are two historic 230 kV electrical transmission lines and associated towers in parallel with one another. The historic context of these high voltage electrical transmission lines is rooted in the creation of the Sacramento Municipal Utility District (SMUD). In 1923, citizens voted to create SMUD as a community-owned electrical service. Years of engineering studies and legal wrangling delayed SMUD's purchase of the Pacific Gas and Electric Company's (PG&E's) local electrical system. However, in March, 1946, the California Supreme Court denied PG&E's final petition to halt the sale, and nine months later, SMUD finally began operation, acquiring much of the PG&E system in Sacramento County.

By the mid-1960s, agriculture was no longer the Sacramento Valley's largest business. New companies, such as electronics and defense industries, were moving in, changing Sacramento's profile and economy. The Port of Sacramento began handling ocean-going vessels. A major regional airport took shape in the rice fields west of Sacramento. A peach orchard near the American River was transformed into Sacramento State College. Housing subdivisions and apartment buildings were put up everywhere as the population base of SMUD customers surged to 625,000 by 1964. The Upper American River Project began providing electricity to the valley, as SMUD expanded its distribution system of electrical poles and wires.

By the mid- 1960s, 95 percent of the system had been rebuilt or newly constructed. A modern headquarters building was constructed at 62nd and S Streets in Sacramento in the late 1960s. To meet the increased demand for power in the greater Sacramento area, SMUD approved the construction of Rancho Seco, a nuclear power plant to be built on 2,100 acres in the southeastern corner of the county (Sacramento Municipal Utility District

2018).

The transmission towers of the 1920s were much like the ones installed through the 1940s-1960s, including those built by PG&E and SMUD. The towers were made of steel, riveted together with lattice and bent for support. Transmission lines were attached to the top of the tower along a slightly arched or v-shaped riveted steel lattice brace. In an electrical power grid or transmission system, the electricity first travels to a transformer at the power plant that boosts the voltage. The long thick cables of transmission lines were made of copper or aluminum because the two metals have a low resistance. At the user end of the high voltage line, transformers reduced the very high voltage to lower voltage electricity supplied to businesses and residential neighborhoods.

In 1968, leading industrial designer Henry Dreyfuss worked with engineers in southern California to produce the nation's first aesthetic transmission towers. The new towers were drastically different from those of the 1920s-1960s. The fact that numerous 1920s-1960s era towers remain standing is a testament to the design skills of the early engineers who created the lattice towers and to the contractors who erected the high voltage electrical system. Today, California is laced with thousands of *circa* 1920s-1960s steel electrical transmission towers that support many miles of transmission lines (Pacific Gas &Electric Company 2018).

Records Search Results

The North Central Information Center, California Historical Resources Information System provided a records search of The Ranch dated June 2, 2017 (NCIC File No. SAC-17-67). A search of the information center's files resulted in a finding of no cultural resources located within the project area. The search did, however, identify two previously recorded cultural resources outside of the project area, but within a one-quarter mile radius of the project site. The records search identified six previous cultural resource reports within the project area, which may have included cultural resource inventories immediately adjacent to the project's APE, though only one previous survey encompassed the APE according to the GIS map accompanying the records search. That survey was designated S-5843 by the information center and was conducted by Peak & Associates, Inc. back in 2005 (*Determination of Eligibility and Effect for the Sunbridge Park Project Area*). No cultural resources were identified on the information center's file for report S-5843 (Peak 2005a).

Also in 2005, Melinda Peak completed a report on the same property renamed, *Determination of Eligibility and Effect for the Jaeger 530 Project Area, Sacramento County, California* (Peak 2005b).

Although no cultural resources were recorded within the project APE, the records search identified the Wietsma Dairy (P-34-533) and the George Jaeger (home) ranch (P-34-1065) located within a one-quarter mile radius of the present APE.

The 1916 USGS Buffalo Creek 7.5 minute quadrangle included with the records search did not illustrate any man-made buildings or structures within the APE. However, two buildings were illustrated within a quarter mile north of the APE in the same section (Section 16). Also, a north-south road (Jaeger Road) is illustrated adjacent to the west side of the APE. An east-west road (Douglas Road) is illustrated within one-quarter mile north and east of the APE.

The 1954 USGS Buffalo Creek 7.5 minute quadrangle also does not illustrate any man-made buildings or structures within the APE. However, three small reservoirs are illustrated within one quarter mile north of the APE and Jaeger Road is illustrated adjacent to the west boundary of the APE.

As no previously recorded cultural resources were on file with the information center for the APE, the Office

of Historic Preservation's (OHP's) Archaeological Determinations of Eligibility was not searched for sites with relevant trinomial designations. Also for the same reason, OHP's Directory of Properties in the Historic Property Data File for Sacramento County was not searched by Primary Number.

Information center staff reported nothing listed in local inventories No bridges were located within the APE. Therefore, a search of the Caltrans Bridge Survey was not conducted (see Appendix B: Confidential Records Search).

Native American and Historical Society Coordination

During the last study by Melinda Peak, a search of the Native American Heritage Commission's Sacred Lands File was negative; no Native American cultural resources were identified in the file search. The commission provided Peak with a list of Native American contacts, to whom Peak sent letter. The list of contacts included the following:

- Leland Daniels
- Glenn Villa, Sr., Ione Band of Miwok Indians
- Pamela Baumgarter, Ione Band of Miwok Indians
- Clifford McKean, Miwok Indian Community of the Wilton Rancheria
- Dwight Dutschke, Sierra Native American Council
- Mary Daniels-Tarango, Wilton Rancheria

Peak received no responses from the letters (Peak 2005b:12).

On May 30, 2017, the Native American Heritage Commission responded to a request for an updated Sacred Lands File search and Native American contacts. The file search was negative. No Native American cultural resources were identified by commission staff in the immediate project area. Commission staff recommended contacting other sources for information on known and documented sites (see Appendix C: Native American and Historical Society Coordination).

Staff included a list of Native American contacts with its letter report:

- Mr. Randy Yonemura, Ione Band of Miwok Indians;
- Ms. Rhonda Morningstar Pope, Chairperson, Buena Vista Rancheria, Sacramento;
- Mr. Cosme Valdez, interim Chief Executive Officer, Nashville-Eldorado Miwok;
- Ms. Crystal Martinez, Chairperson, Ione Band of Miwok Indians;
- Mr. Grayson Coney, Cultural Director, Tsi Akim Maidu;
- Mr. Nicholas Fonseca, Chairperson, Shingle Springs Band of Miwok Indians, Shingle Springs;
- Mr. Don Ryberg, Chairperson, Tsi Akim Maidu;
- Mr. Raymond Hitchcock, Chairperson, Wilton Rancheria;
- Mr. Gene Whitehouse, Chairperson, United Auburn Indian Community of the Auburn Rancheria, Auburn.

A letter dated April 26, 2018 along with a location map was mailed to each of the above contacts describing the project and asking for volunteered information on the location of any sacred or other sites of importance to Native American tribal groups. A follow-up telephone call was made to each contact on May 8, 2018.

In a letter dated May 10, 2018 that appeared to be a standard response, Mr. Gene Whitehouse, Chairman, United Auburn Indian Community of the Auburn Rancheria (UAIC) stated that the UAIC is concerned about

development within its aboriginal territory including potential impact on the lifeways, cultural sites, and landscapes that may be of sacred or ceremonial importance. To ascertain if the project could affect cultural resources of importance to the UAIC, the UAIC would like to consult on the project. In addition, the UAIC would like to received copies of any archaeological reports, environmental documents and the opportunity to comment on the identification, assessment and mitigation related to cultural resources. The UAIC also recommends that UAIC tribal representatives observe and participate in all cultural resource surveys. The letter ended with the statement that the UAIC Preservation Committee requests a meeting or site visit and for further contact, address Mr. Marcos Guerrero, Cultural Resource Manager at UAIC. Mr. Whitehouse's letter did not identify any specific sites of Native American importance within or near the APE. No other responses from tribal contacts have been received to date (June 28, 2018).

Earlier, on May 22, 2017, an email was sent to the Sacramento County Historical Society and to the Elk Grove Historical Society. The email described the project, its location and requested information on potential historic sites that may be impacted by the proposed project. There was one response. Mr. Jim Entrican, Elk Grove Historical Society responded on several occasions with a discussion of pioneer families in the region, but did not specify any historic sites located at the project location.

There was no response from the Sacramento Historical Society. A second email was sent to the Sacramento Historical Society on May 8, 2018. However, no response has been received at the time of this writing (June 28, 2018).

Research Methods

In December, 2004, Peak & Associates, Inc. completed a field survey of the APE. The field team consisted of Ann Peak, M.A., assisted by a graduate student in anthropology from California State University Sacramento, and Leland Daniels, archaeological technician. The field survey was described as a complete inspection. Ground visibility was fair to good. No prehistoric or historic period resources were identified (Peak 2005b).

In April, 2018, Ric Windmiller, M.A., conducted a pedestrian reconnaissance of the APE along widely spaced transects as a check on the adequacy of the previous Peak & Associates survey. Ground visibility was fair to good; grass was cropped close to the ground by grazing cattle. One person day was expended on the reconnaissance. Expectations of finding prehistoric or historic archaeological resources were low. None were identified. However, a double row of parallel high voltage electric transmission lines cross the APE northeast to southwest. The towers were recorded on DPR 523 series forms by architectural historian Dana Supernowicz, M.A.

Ric Windmiller has more than 40 years experience directing archaeological field surveys and excavations in California, Arizona, Colorado, Canada and Mexico. Windmiller has a B.A. in anthropology from California State University, Sacramento, M.A. in anthropology from the University of Manitoba, Canada, and all but dissertation for a Ph.D. in the same field, University of Colorado.

Dana Supernowicz, M.A. is a senior historian with more than 30 years of experience conducting historical research in northern California including Sacramento County. Dana Supernowicz is formerly with the California Department of Transportation (Caltrans) and El Dorado National Forest.

Description of Cultural Resources

The only cultural resources identified within the APE, 50 years old and older are two parallel rows of high voltage electrical transmission towers and lines (see Appendix D, Confidential Location of Cultural Resources and Appendix E, Confidential Record Forms).

Prehistoric Resources

No prehistoric resources were identified.

Historic Resources

P-34-5210 (SMUD Electrical Transmission Towers and Lines)

The subject property consists of two parallel rows of 230kV electrical transmission towers with attached transmission lines. The towers are over 100 feet high and made of riveted steel with lattice bracing, owned and operated by Sacramento Municipal Utility District (SMUD). The double row of towers traverse the APE northeast to southwest along a utility easement owned by SMUD. Each tower has three horizontal arms or masts mounted to the upper half of the tower. The rectangular, truncated-shaped lattice transmission towers rest on four concrete piers. A form of "X" bracing with radiating steel lattice braces is used on opposing sides of the towers for support. The three steel arms on each tower, also containing lattice bracing, connect to twisted or elongated insulators attached to high lead cables that transmit electricity from tower to tower. The double line of towers cuts through a large swath of agricultural open-space land, terminating to the west at the West Hedge Substation at Elder Creek. The subject transmission towers were reportedly constructed between 1961 and 1968, which is based on a review of historic topographic maps and aerial photographs.

Assessment of Eligibility

Generally, a historic site, object, building, structure or district is eligible for listing on the National Register of Historic Places if it is 50 years old or older, possesses integrity and meets at least one of the following criteria (National Park Service 1991:4):

A. Association with events that have made significant contributions to the broad patterns of United States history.

B. Association with the lives of people important in United States history.

C. Embodies the distinctive characteristics of a type, period, or method of construction; or represents the work of a master, or possesses high artistic value, or represents a significant and distinguishable entity whose components may lack individual distinction;

D. Has yielded or is likely to yield information important in prehistory or history.

National Register eligibility is equally dependent on the condition or integrity of the cultural resource. Integrity, in this sense, is the authenticity of the cultural resource's historic identity, meaning the survival of those physical characteristics that existed during the historic or prehistoric period from which it dates. The integrity of archaeological resources is generally based on the degree to which the remaining cultural deposit,

artifacts or features can provide information important to our understanding of history or prehistory.

Integrity is a composite of seven qualities, some of which are more germane than others, depending on the type of cultural resource under evaluation and the criterion of National Register eligibility for which the evaluation is made. The aspects of integrity are: location, design, setting, materials, workmanship, feeling and association (National Park Service 1991:4).

Prehistoric Resources

No prehistoric resources were identified.

Historic Resources

P-34-5210 (SMUD Electrical Transmission Towers and Lines)

The historic context of the subject property is rooted in the creation of the Sacramento Municipal Utility District (SMUD). In 1923, citizens voted to create SMUD as a community-owned electric service, but years of engineering studies and political wrangling delayed SMUD's purchase of Pacific Gas and Electric Company's (PG&E's) local electrical service. In March, 1946, the California Supreme Court finally denied PG&E's argument against the acquisition. Nine months later, SMUD began operations by acquiring much of PG&E's system in Sacramento County. By 1964, SMUD's customer base swelled to 625,000 due to the re-shaping of the county's economy from primarily agriculture to electronics and defense industries. By this time, Sacramento was also becoming a major transportation hub with the growth in ocean-going shipping and air transport. The Upper American River project began providing electrical service to the valley, as SMUD expanded its distribution system of electrical poles and wires. By the mid-1960s, 95 percent of the system had been rebuilt or newly constructed.

In applying National Register of Historic Places criteria of eligibility, two of the criteria were particularly important in assessing the significance of the subject property. Criterion A was applied due to the property's relationship with electrical power generation and transmission in northern California, particularly Sacramento County, where the two parallel rows of transmission towers are located. The years following World War II were an important period of growth. SMUD met the demands for power with expanded infrastructure including construction of the Rancho Seco nuclear power plant.

National Register Criterion C was also applied to the property, because the steel towers are an engineering feature related to the development of other similar types of properties after the turn of the 19th century, including windmills, fire lookout towers and radio towers. Criterion B and D were not applicable.

Comparing tower types, the lattice bracing and height of a transmission tower often denote its age in regard to high lead electric power transmission. Although the basic principles of transmission tower design changed little from the 1920s through the 1960s, many towers were designed substantially larger and taller through time. Because the subject towers are among a chain or line of similar transmission towers, eligibility must be considered both individually and as part of a linear district comprised of multiple steel transmission towers and electrical line ties to substations and power generating plants. However, as the APE limits assessment of a district beyond the APE, only the towers and lines located within the APE are considered here.

The transmission towers appear to retain good integrity of design, materials, setting, association and feeling having minimal or no apparent alterations. Conversely, hundreds of similar transmission towers were built

throughout California, including those built by PG&E and SMUD in Sacramento County. The two parallel lines of transmission towers within the APE serve south Sacramento County, trending northeast to southwest through agricultural lands with suburban encroachment.

These two power lines were not the first electrical high-lead tie lines built in the state nor in Sacramento County. The post-World War II period of electrical transmission generation and development was spurred by rapid population growth and increasing demand from commercial and residential customers. Most of the existing steel high-lead electrical transmission towers in California date to the period after World War II. While the subject towers are critical to providing electricity to a large swath of south Sacramento, and the towers retain integrity, they were built in the 1960s, a period in which transmission tower design and engineering was quite mature. Furthermore, the transmission towers, while important, do not represent a significant event or events in the history of Sacramento County, as compared to the construction of SMUD's first and only nuclear plant in the late 1960s. Therefore the two lines of transmission towers located within the APE do not appear to be individually eligible for the National Register under either Criterion A or C.

In regards to a linear district, the subject towers are representative of a mid-twentieth century class of riveted steel transmission towers associated with substations that together had an important influence on the economic and physical development of northern California, particularly Sacramento County. However, because the tie line or power grid is not one of the major north-south or east-west power grids in California that collectively provide the bulk of the power to the state, the property's value does not rise to the level of significance for consideration as a historic property eligible for listing on the National Register. Finally, upon evaluating its engineering design, the twin rows of towers do not appear to meet the level of significance that would qualify them collectively as a National Register eligible district with the period of significance as the mid-1960s.

Assessment of Effect

For purposes of the Section 106 consultation, "effect" is defined as "alteration to the characteristics of a historic property qualifying it for inclusion in or eligibility for the National Register" [36 CFR Part 800.16(I)].

Adverse effects may include reasonably foreseeable effects caused by an undertaking that may occur later in time or removed by distance or cumulative. Adverse effects are found when an undertaking " . . . may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location design, setting, materials, workmanship, feeling, or association: (36 CFR Part 800.5(a)(1).

Only one cultural resource was identified within the APE: the twin rows of 1960s-era high voltage electrical transmission towers and lines. The two characteristics that would qualify the resource for inclusion in or eligibility for the National Register are the steel lattice towers and the transmission lines. Construction of the proposed development will not alter either of these characteristics. Application of the criteria of eligibility concluded that the towers and lines located within the APE are not individually eligible or collectively eligible as a National Register historic district under any criterion. Therefore, it is the consultant's opinion that no historic properties will be affected.

RE: The Ranch Permitting Services, Buffalo Creek, Sacramento County

Dear Mr. Windmiller:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results. **Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE.**

I suggest you contact all of those listed, if they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. **By contacting all those on the list, your organization will be better able to respond to claims of failure to consult**. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: Sharaya.souza@nahc.ca.gov.

Sincerely,

Sharaya Souza

Re: "The Ranch" residential development, Rancho Cordova, Sacramento County

Dear Mr. Whitehouse:

The Ranch is a 530 acre undeveloped property located south of Douglas Road and east of Jaeger Road in the south portion of Rancho Cordova. The project is a planned residential development that will connect with existing modern residential developments on the west and north. As a Clean Water Act, Section 404 permit is anticipated, we (Windmiller Consulting, Inc.), are assisting the Corps of Engineers by updating a previous cultural resources study of the same property (see attached map).

The Native American Heritage Commission completed an updated Sacred Lands File search with negative results. In addition, commission staff provided us with a list of recommended contacts with your name included who may have additional information on the location of sacred and other sites of Native American importance. Any such information will be added to our technical report. If you wish to volunteer information at this time regarding sites that may be of importance to Native Americans, please contact Cathryn Chatterton at the above address. You may also respond by telephone (530-878-0979), fax (530-878-0915) or email: windmiller-consult@sbcglobal.net. We would appreciate a response at your earliest convenience if you wish to comment at this time.

Yours sincerely,

Ric Windmiller
Archaeologist

Subject: The Ranch Residential Development, Rancho Cordova, Sacramento County

Dear Ric Windmiller,

Thank you for requesting information regarding the above referenced project. The United Auburn Indian Community (UAIC) of the Auburn Rancheria is comprised of Miwok and Southern Maidu (Nisenan) people whose tribal lands are within Placer County and whose service area includes El Dorado, Nevada, Placer, Sacramento, Sutter, and Yuba counties. The UAIC is concerned about development within its aboriginal territory that has potential to impact the lifeways, cultural sites, and landscapes that may be of sacred or ceremonial significance. We appreciate the opportunity to comment on this and other projects. The UAIC would like to consult on this project.

In order to ascertain whether the project could affect cultural resources that may be of importance to the UAIC, we would like to receive copies of any archaeological reports that are completed for the project. We also request copies of environmental documents for the proposed project so that we have the opportunity to comment on appropriate identification, assessment and mitigation related to cultural resources. Finally, we request and recommend that UAIC tribal representatives observe and participate in all cultural resource surveys. To assist in locating and identifying cultural resources, UAIC's Preservation Department offers a mapping, records and literature search services program. This program has been shown to assist project proponents in complying with applicable environmental protection laws and choosing the appropriate mitigation measures or form of environmental documentation during the planning process. If you are interested in the program, please let us know.

The UAIC's Preservation Committee would like to set up a meeting or site visit, and begin consulting on the proposed project. Based on the Preservation Committee's identification of cultural resources in and around your project area, the UAIC recommends that a tribal monitor be present during any ground disturbing activities. Thank you again for taking these matters into consideration, and for involving the UAIC early in the planning process. We look forward to reviewing the documents requested above and consulting on your project. Please contact Marcos Guerrero, Cultural Resources Manager, at (530) 883-2364 or by email at mguerrero@auburnrancheria.com if you have any questions.

Sincerely,

Gene Whitehouse,
Chairman

CC: Marcos Guerrero, CRM

Ric Windmiller <windmiller-consult@sbcglobal.net>
To Jim Entrican 5-22-2017 at 11:34 AM

Hi Jim,

We're continuing to do technical studies for projects in Sacramento and surrounding counties. "The Ranch" is a 530-acre property in Section 16 just south of Douglas Road between Grant Line and Sunrise. We are assisting the U.S. Army Corps of Engineers in meeting its responsibility to identify any important historic (and prehistoric) sites on The Ranch property. We solicit information from Native Americans as well as historical societies on sites that may be impacted as a result of issuing discretionary permits.

Apparently, the property was originally owned by Louis Lepetit, which seems to ring a bell with me in connection with Elk Grove's history. Around 1880, Lepetit sold the land to George Jaeger who held it to his death in 1907. Apparently, Jaeger did not live on the property in Section 16, but had a place in Section 9 and later moved to Sacramento. At some point, Jaeger sold his El Dorado County land (480 acres) to Alex Forni, another familiar name. Jaeger's name shows up on lists for Cosumne, Sloughhouse and Michigan Bar.

Any comments? See attached map for location of "The Ranch."

At some point, Jaeger sold his El Dorado County land (480 acres) to Alex Forni, another familiar name. Jaeger's name shows up on lists for Cosumne, Sloughhouse and Michigan Bar.

The Ranch property appears to have been ranch/farm land. Do you know of any historic sites located on the property? I can provide you with a map showing the property's location. I would appreciate any comments you may have at this time.

Thanks, Ric

Ric Windmiller <windmiller-consult@sbcglobal.net>
To rhonda@buenavistatribe.com crystal@ionemiwok.org Randy Yonemura Cosme Valdez nfonseca@ssband.org and 2 more... 6-28-2018 at 9:52 AM

All,

The Ranch is a proposed 530-acre mixed use community in the south portion of the City of Rancho Cordova, Sacramento County, California. The Ranch lies on the east side of Jaeger Road, south of Douglas Road, one mile east of Sunrise Boulevard and one mile west of Grant Line Road (see attached map).

The Native American Heritage Commission reported that its Sacred Lands File search was negative. Archaeological field surveys also did not identify any Native American archaeological resources.

We recognize that sacred or ceremonial sites may not be recognized on the ground by non-Native American archaeologists. We attempted to contact you back in April to see if you have any knowledge of such sacred sites located within the project's APE. United Auburn Indian Community responded earlier to our request. If you wish to volunteer any information, please contact us as soon as possible if you wish to respond at this time.

Preliminary Geotechnical Engineering Report
JAEGER RANCH PROPERTY
Rancho Cordova Parkway near Pericles Drive
Rancho Cordova, California
WKA No. 11103.02
September 26, 2016

INTRODUCTION

We have completed a preliminary evaluation of the subsurface soil and groundwater conditions at the Jaeger Ranch property located easterly of the intersection of Rancho Cordova Parkway and Pericles Drive in Rancho Cordova, California (see Figure 1). The purpose of our study has been to gather information on the nature and general engineering properties of the soil and groundwater conditions at the site, and to provide findings and conclusions regarding the feasibility of developing the site with a residential subdivision.

It is emphasized that the findings and conclusions contained in this report are preliminary in nature and are not intended for use in specific design of structural improvements. This study is limited to a general overview of soil and groundwater conditions to assist in planning and budgeting for the project.

Scope of Services

The scope of services for the project included the following:

1. site reconnaissance;
2. review of available reports, historical aerial photographs, topographic maps, groundwater information, geologic maps, and of the United States Department of Agriculture Natural Resources Conservation Service (NRCS) Web Soil Survey;
3. subsurface exploration, including the excavation and sampling of 10 test pits across the site to a maximum depth of 10½ feet below existing grades;
4. laboratory testing of select soil samples;
5. engineering analysis; and,
6. preparation of this preliminary geotechnical report.

Supplemental information reviewed during the preparation of this report included the review of our *Draft Phase I Environmental Site Assessment* (WKA No. 11103.01, dated September 22, 2016), prepared for the subject property.

Figures and Attachments

A Vicinity Map is presented as Figure 1 and a Site Plan showing the locations of our test pits is presented as Figure 2. Logs of Test Pits are presented as Figures 3 through 12, and an explanation of the symbols and classification system used on the logs appears on Figure 13. Appendix A contains general information regarding this investigation; and, a description of the field exploration and laboratory testing.

Proposed Development

The subject property is rectangular in shape and encompasses a total area of approximately 529 acres of vacant, undeveloped, agricultural land. The property consists of one parcel identified as Sacramento County Assessor Parcel Number 067-0040-008-0000.

We understand the major components of the property will consist of about 200 acres of residential (including high-density residential), about 6 acres of commercial developments, a recreation center, and about 245 acres of designated nature preserves. Residential structures are currently planned to consist of one- and two-story structures, with the high-density, residential structures potentially being as much as three stories in height. We anticipate these residential structures will be wood-framed with interior concrete slab-on-grade lower floors. We understand that the commercial and recreation center structures are likewise currently planned to be one- or two-story structures. Structural loads are anticipated to be relatively light and consistent with this type of construction. Associated development will include underground utilities, exterior flatwork, retaining walls, new streets and typical residential landscaping.

FINDINGS

Site Description

The project site is comprised of approximately 529 acres, located easterly of the intersection of Pericles Drive and Rancho Cordova Parkway in Rancho Cordova, California (Figure 1). The property is bounded to the north and east by existing residential subdivisions and grazing/ranch land; and to the south and west by grazing land containing a few minor ranch structures and houses. Blodgett Reservoir lies about one-mile south of the site and an unnamed minor reservoir lies about a half mile to the east of the site near some existing housing and ranch structures. Topography across the site generally consists of modest rolling hills. Review of topographic maps of the area indicates the site elevations[1] vary from a high point of just over +200 feet relative to mean seal level (msl) to a low point of just under +180 feet msl (North American Vertical Datum of 1988).

[1] All elevations reported are provided with respect to the North American Vertical Datum of 1988 (NAVD88). Reported elevations in this report are approximate, and are generally based on available topographic data from the United States Geological Society.

At the time of our field exploration activities in August and September of 2016, the major portion of the property consists of vacant, grazing land, with vernal ponds and streams draining in from the northeast corner towards the southwest corner of the site. The property is covered with a moderate growth of volunteer weeds and grass up to 3 feet in height. High-voltrage transmission power lines cross through the site extending from the substation located immediately north of the northeast corner of the site and extending to the south west through the site. A fenced yard containing a transformer and monitoring well (EX-22) were observed about 1100 feet south of where Big Meadow Way intersects the northern boundary of the site. One other well (EX-27) is located near the northeast corner of the site along the northern boundary.

Minor amounts of domestic refuse were observed along then northern and western site boundaries. In addition, three livestock watering troughs were observed along the northern site boundary, and a metal water storage tank was observed north of the existing groundwater extraction well. Additional details regarding these wells and associated structures can be found in our *Phase I Environmental Site Assessment* (WKA No. 11103.01, dated September 22, 2016).

Site History

Review of available historic maps and aerial photographs indicates the site has historically remained essentially vacant since the early 1800's. Dry farming and livestock grazing appear to have been the historic land uses. In addition, there has been some minor development of the site including installation of monitoring wells and groundwater extraction wells (associated with the former McDonald Douglas/Rancho Cordova Test Site located north of the site), high-voltage transmission power lines, and a small transformer associated with the power lines.

General Site Geology

The site is located within the northeastern portion of the Great Valley geomorphic province of California. The Great Valley of California is generally considered to be an elongated sedimentary trough, approximately 450 miles long and 50 miles wide, which has been filled by a thick sequence of Jurassic to Holocene continental and marine sediments. The sediments have been folded into an asymmetric syncline, the axis of which lies immediately east of the interior of the Coast Ranges. The geology in the Great Valley is characterized by thick sequences of alluvial and flood plain deposits consisting of sedimentary material derived from the Coast Ranges to the west and the Sierra Nevada mountain range to the east.

The local geology, as characterized by the Geologic Map of the Sacramento Quadrangle, California (1981), consists primarily of Laguna Formation deposits (Tl) which are consolidated Tertiary age alluvial deposits. Surface soil deposits were mapped by the NRCS as consisting of the following units:

- Fiddyment Fine Sandy Loam, 1 to 8 percent slopes (0.4% of area of interest - AOI[2]);
- Hicksville gravelly loam, 0 o 2 percent slopes, occasionally flooded (2.4% of AOI);
- Red Bluff-Redding complex, 0 to 5 percent slopes (16.2% of AOI);
- Redding loam, 2 to 8 percent slopes (10.7% of AOI); and,
- Redding gravelly loam, 0 to 8 percent slopes (70.4% of AOI).

The NRCS also maps the site use with the following characteristics:

- Somewhat limited for small commercial buildings, and dwellings without basements, due in part to the presence of expansive soils.
- Somewhat limited for excavations, due in part to the stability of excavation walls.
- Somewhat limited for local roads and streets, due in part to presence of expansive soils.
- Low to Moderate corrosion potential to concrete.

The soils encountered in the test pits excavated on site were generally consistent with these mapped soil units based on laboratory testing and field and laboratory classification of soils.

Soil and Rock Conditions

The site is generally composed of loose to medium dense, alluvial deposits consisting of silty and clayey sand, lean clay, gravels, and clayey gravel. Surface soils in the upper two to three feet generally consist of silty or clayey sand or sandy, silty clay with some gravel and occasional cobbles. These soils generally have a low plasticity index (PI) of 6 or less and dry unit weights ranging from 109 to 119 pounds per cubic foot (pcf), with some potential for corrosion (pH = 5.22). Soils beneath the silty sand to a depth of approximately 4 to 8 feet consist of clay and silty or clayey sand with some gravel and cobbles. These soils generally have a higher plasticity index (PI = 16 to 20) and dry unit weights ranging from 89 to 112 pcf. Beneath these soils are sand, silty sand, gravel, and clayey gravel with some cobbles extending to the maximum depth explored of 10½ feet below existing grades. Cobbles of up to 6 inches were observed in many locations increasing in concentration with depth.

Detailed soil descriptions and soil lithology at a specific test pit location are provided in logs of the test pits presented in Figures 3 through 12. At the conclusion of the field explorations, the test pits were backfilled with excavation spoils compacted with a sheepsfoot wheel attachment.

[2] Coverages of area of interest are approximate.

Groundwater

The site is located within the California department of Water Resources defined Sacramento Valley Groundwater Basin/South American Sub-Basin of the Sacramento River Hydrologic Region.

Groundwater was not encountered in the test pits excavated at the site in August of 2016. Based on groundwater depth observations taken from 2008 to 2012 in nearby wells (e.g. Wells EX-20, EX-21, EX-22, and EX-27 from Central Valley Regional Water Quality Control Board Case Number SL205493018) permanent groundwater is anticipated to vary between 150 and 240 feet below existing surface grades.

However, perched seasonal groundwater is anticipated to occur at this site. Surface water features observed during site exploration activities included vernal ponds and ephemeral streams/washes. Based on these surface features, and the underlying geology, we anticipate the perched groundwater conditions are likely to occur at the site with potential for significant surface water flows. Perched groundwater conditions should be expected after heavy rainfall or during the wetter seasons of the year.

PRELIMINARY CONCLUSIONS AND RECOMMENDATIONS

Seismic Hazards

The Alquist-Priolo (AP) Earthquake Fault Zoning Act regulates activities near active faults within what is known as an earthquake fault zone. Active faults are defined as a fault that has ruptured in the last 11,000 years. Review of the AP Maps of California, prepared by the California Geological Survey (CGS), shows that there are no regulated earthquake fault zones near the site.

We note, however, that low to moderate amounts of earthquake induced ground shaking can occur at the site. The average peak ground acceleration (PGA_M) at the site for the maximum considered earthquake (MCE) event (per ASCE 7-10) is 0.244 g.

Faults likely contributing significantly to this hazard include the Hunting Creek – Berryessa Fault and the Great Valley fault system among other sources. The closest fault zone to the site is the Foothills Fault System, located about 20 miles north east of the site. The Foothills Fault System has been historically active, with magnitude 5 to 6 events occurring in 1975 near Oroville, CA and microseismicity recorded in the vicinity of the Penryn and Rocklin plutons (Cramer et al., 1978).

No known active faults cross through the site and fault displacement hazard is considered to be negligible at the site.

Seismic Design Parameters (2013 CBC/ASCE 7-10)

Code based seismic design parameters were developed for the site consistent with section 1613 of the 2013 edition of the California Building Code (2013 CBC), which references the American Society of Civil Engineers Standard 7-10 (ASCE 7-10). For the purposes of preliminary evaluations, we assumed a site class of D for the site.

Seismic design parameters were obtained for Site Class D using the online USGS U.S. Seismic Design Maps application. Using this tool, values were obtained for a point near the center of the site located at latitude 38.5423˚ and longitude -121.2091˚, and are provided in Table 1. These seismic design parameters may be used for preliminary evaluations. Applicability to the site should be confirmed prior to use in final design.

TABLE 1
2013 CBC/ASCE 7-10 SEISMIC DESIGN PARAMETERS

g = gravity
sec = seconds

Liquefaction Potential

Earthquake induced soil hazards to buildings associated with seismicity include liquefaction and seismically induced bearing capacity failure, lateral spreading, and total/differential settlement of soils below foundations. These effects, when significant, can contribute to structural damage or collapse of structures, and damage to utilities and other engineered structures. Typically, the risk of these types of hazards occurring is considered low in the Central Valley due to the low potential for nearby large magnitude seismic events.

Groundwater at the site is greater than 50 feet below grades, and saturated soils were not encountered during site exploration activities. Soils will likely remain unsaturated during the majority of the year, and are thus not considered susceptible to liquefaction. The silty sands, and sands are susceptible to seismic compression.

Based on this, it is our opinion that liquefaction potential at the site is considered very low. However, the low to moderate ground shaking expected at the site may be capable of causing some limited settlement in the sands. The expected total and differential settlements of the soils should be evaluated in more detail in a final geotechnical engineering report.

Naturally Occurring Asbestos (NOA)

Review of *Relative Likelihood for the Presence of Naturally Occurring Asbestos in Eastern Sacramento County, California* (Higgins and Clinkenbeard, 2006) indicates the site is not likely to be underlain by ultramafic rocks likely to contain naturally occurring asbestos. In addition, we did not observe or encounter ultramafic rocks likely to contain naturally occurring asbestos. Therefore, naturally occurring asbestos is not considered likely to exist at the site.

Soil Expansion Potential

According to section 1803.5.3 of the *California Building Code*, soils with a PI greater than 15, more than 10 percent fines, and having more than 10 percent of particles less than 5 micrometers in size; and/or soils having an expansion index (EI) of more than 20 shall be considered expansive.

Laboratory test results performed on samples collected in the upper 2 to 3 feet indicate that these soils typically have a PI of less than 15 and can be considered to have a low expansion potential. The soils beneath about two feet typically have a PI of greater than 15, and should be considered to have a low to moderate expansion potential. Additional testing of the clay and silty/clay should be conducted to confirm the expansive potential of this soil layer prior to final design. These soils were typically encountered in the northwestern area of the property, with the presence of these soils less prominent to the south and east.

Based on the presence of the low to moderately expansive clay at the site, recommendations to mitigate the effects of the expansive clay would be provided for the design-level geotechnical report. Mitigation measures will likely be required if final site grades will expose the clayey subgrade or of the clayey soils are within the upper 12 to 18 inches of the final building pads, exterior flatwork, or pavement subgrades. Typical mitigation includes deepened conventional foundations and/or use of post-tensioned slabs.

Soil Corrosion Potential

One sample of near-surface soil from TP5 was submitted to Sunland Analytical Lab for testing to determine pH, chloride and sulfate concentrations, and minimum resistivity to help evaluate the soils corrosion potential. The results of the corrosivity testing are summarized in Table 2 and copies of the analytical test reports are presented in Figures A6 through A7.

TABLE 2
SOIL CORROSIVITY TESTING

Analyte	Test Method	TP3 (0'-3')
pH	CA DOT 643 Modified*	5.22
Minimum Resistivity	CA DOT 643 Modified*	7,500 Ω-cm
Chloride	CA DOT 417	6.5 ppm
Sulfate	CA DOT 422	1.9 ppm
	ASTM D516	2.04 ppm

NOTES: * = Small cell method, Ω-cm = Ohm-centimeters, ppm = Parts per million

The California Department of Transportation Corrosion and Structural Concrete Field Investigation Branch, 2012 Corrosion Guidelines, considers a site to be corrosive to foundation elements if one or more of the following conditions exists for the representative soil and/or water samples taken: has a chloride concentration greater than or equal to 500 ppm, sulfate concentration greater than or equal to 2000 ppm, or a pH of 5.5 or less (Caltrans, 2012).

Based on this criterion, soils tested with a lower pH and may be considered corrosive to steel reinforcement properly embedded within Portland cement concrete (PCC).

Table 19.3.1.1 – Exposure Categories and Classes, of American Concrete Institute (ACI) 318-14, Section 19.3 – Concrete Design and Durability Requirements, as referenced in Section 1904.1 of the 2013 CBC, indicates the severity of sulfate exposure for the sample tested is Exposure Class S0 (water-soluble sulfate concentration in contact with concrete is low and injurious sulfate attack is not a concern). However, additional requirements for concrete strength and design may be required for soils with low pH. Consideration to the potential corrosive nature of soil should be considered in development of the project. Concrete design will ultimately need to be developed by a structural engineer, who should evaluate the requirements of ACI 318-14 and determine their applicability to the site.

Wallace-Kuhl & Associates are not corrosion engineers. Therefore, if it is desired to further define the soil corrosion potential at the site a corrosion engineer should be consulted.

Building Support

An important aspect of site development will be the adequate clearing of surface and subsurface items associated with the existing vegetation and depressions revealed during site grading. Proper abandonment of irrigation and domestic wells, if any, must be performed in accordance with the Sacramento County Environmental Management Department requirements. Wells not designated for abandonment should be appropriately protected against damage.

It is our opinion that undisturbed native soils and/or recompacted native soils will be capable of supporting the proposed structures and pavements provided the further preliminary recommendations regarding preparation and soil compaction are followed. Our work also indicates that engineered fill, properly placed and compacted in accordance with the recommendations of this report, will be capable of supporting the proposed improvements.

Buildings where expansive clayey soils are encountered within the upper 12 to 18 inches of the foundations or final building pad subgrade will require specific recommendations to mitigate the effects of the expansive soils. Mitigation measures may include deepening foundations, post-tension (PT) construction, and/or removal of the expansive clays and replacement with non-expansive engineered fill.

Excavation Conditions

Soil test pits were excavated to depths ranging from 7 to 10½ feet with a Case 580 Super M backhoe. Excavation refusal was generally reached at depths of 7 feet or more. Based on this information, and our local experience, we anticipate the soils at the site will be readily excavatable to depths of approximately five feet across most of the site with conventional earthmoving and trenching equipment. Gravely soils and cobbles will be encountered in most locations at the site. Excavations deeper than five feet are likely to encounter greater concentrations of gravel and cobbles and may require additional effort or larger equipment to excavate.

Near surface soils generally consist of silty sands and generally classify as OSHA Type B/C soils requiring excavation slopes of not more than 1H:1V to 1½H:1V (horizontal to vertical) for shallow excavations. Sloped excavations, bracing, and/or shoring may be required to control sloughing and caving of excavations within the near-surface soils at the site. Excavations should be sloped or braced in accordance with current California Occupational Safety and Health Administration (Cal/OSHA) regulations.

The contractor must provide a safely sloped excavation or an adequately constructed and braced shoring system in accordance with federal, state, and local safety regulations for individuals working in an excavation that may expose them to the danger of moving ground. If material is stored or heavy equipment is operated near an excavation, stronger shoring must be used to resist the extra pressure due to the superimposed loads.

Material Suitability for Engineered Fill Construction

In our opinion, the on-site surface and near-surface soils are considered suitable for use as engineered fill materials provided they are appropriately processed such that they are free of debris, do not contain significant concentrations of clay or gravel, are at or near optimum moisture content (e.g. moisture at which adequate compaction can be achieved), and contain organics less than two percent by weight.

Surface soils may require stripping of organics prior to work at the site. Strippings and other organically laden soil stripped from the surface of the site may not be used in fill construction or anywhere within five feet of a structure, pavement, or exterior flatwork.

We anticipate that soils in the upper 2 to 3 feet will require only minimal on site processing after stripping has been completed to meet the requirements for engineered fill. Deeper soils may require more extensive processing including mixing with other soil and breaking down of larger particles to be considered suitable. Additionally, expansive soils if present in the upper 12 to 18 inches beneath the bottom of the foundations may require alternative foundation systems (e.g. post-tensioned slab systems).

Groundwater and Seasonal Moisture

Based on the soil and groundwater conditions encountered at the site, it is our opinion that the static groundwater table should not adversely affect design, construction, or performance of the proposed residential improvements. Although the static groundwater table should not impact future development, perched water may be encountered above and within the soils at the site. The potential for encountering perched water is greater during and shortly after the rainy season; however, perched water could be encountered throughout the year in some areas. Seepage in utility excavations (if encountered) can likely be removed by sump pumps without major dewatering efforts.

We note that an important aspect of this project will be to develop an overall water management plan. The potential for perched groundwater, seeps, and surface ponding at the site is high, especially in the wetter seasons of the year. Management of groundwater using subdrains or similar methods should be incorporated into the overall project plan. Subdrains, if used, should be designed to adequately carry water collected in the system, and should have a designated drainage outlet at an appropriate location.

The near-surface soils will be in a near-saturated condition during and for a considerable period following the rainy season. Grading operations attempted following the onset of winter rains and prior to prolonged drying periods will be hampered by high soil moisture contents. Such soils, intended for use as engineered fill, will require considerable aeration to reach a moisture content that will permit the recommended compaction to be achieved.

Site Clearing and Grading Considerations

Future geotechnical engineering investigations should be performed to develop site-specific clearing and grading recommendations.

Site clearing would include removal of abandoned water wells, and deleterious debris. Excavations and depressions resulting from the removal of these items must be backfilled with engineered fill.

Removal of surface organics would depend on the condition and quantity of the organics at the time grading is to begin. Discing of the organics may be suitable for construction, if the organic concentrations are not too heavy at the time of grading. Stripping of the organics likely would be required if organic concentrations are very thick, with strippings being completely removed from the site or used only in landscape areas.

Loose, soft, organically contaminated, or saturated soils encountered during site preparation, are not considered suitable for support of future improvements. Removal of these materials to expose firm, undisturbed native soils, and backfilling with engineered fill will be required.

Drainage swales to be backfilled should be drained of water, and cleaned of organics and saturated or unstable soils to expose firm, native soil. The excavated soils from the features are anticipated to be at elevated moisture contents and may contain high concentrations of organics; therefore, the materials may need to be disposed of off-site and not reused as fill materials within structural areas. Subsurface drainage should be provided in areas with drainage swales.

Areas designated to receive fill and at-grade areas are typically ripped to a depth of about 12 inches, thoroughly moisture conditioned, and uniformly compacted. Standard fill construction and compaction procedures, including uniform moisture conditioning, placement of fill in six-inch lifts and compaction to at least 90 percent of the maximum dry density, would be suitable for support of the planned structures. Engineered fills placed on sloping ground would need to be properly keyed and benched into existing hillsides.

Typically, only native soils (in lieu of select sand backfill) are recommended for use as backfill in the upper portion of utility trenches located within building footprints and extend at least five feet beyond the perimeter foundation to minimize water transmission beneath the homes. Utility

trench backfill is generally thoroughly moisture conditioned to at least the optimum moisture content and mechanically compacted.

Due to the potential expansion characteristics of the native clay soils, the upper 12 to 18 inches of the final subgrade below the building footprints and at-grade structures, including exterior flatwork, should consist of imported non-expansive engineered fill or on site soils that have been determined to be non-expansive. Consideration may also be given to chemically amending the native clayey soils.

Building Foundations

In general, we anticipate the proposed residential structures at the site could be supported upon conventional continuous and/or isolated spread foundations. Minimum foundation widths of 12 inches for continuous foundation and 18 inches wide for isolated spread foundations would be applicable.

However, areas where clayey soils are exposed or are within 12 to 18 inches of the final building pad may require alternative foundations or designs, such as post-tensioned slabs. Post-tension slabs are typically 10-inches thick with deepened edges.

We anticipate a bearing capacity on the order of 2000 pounds per square foot (psf) for dead plus live load would be applicable for residential foundations bearing in re-compacted native materials, engineered fill, or a combination of these materials.

Interior concrete slab-on-grade floors used in conjunction with conventional foundations would be suitable for this site, provided slabs are properly designed and constructed with regard to reinforcement and moisture vapor penetration resistance. Typical slab reinforcement used in conjunction with deepened conventional foundations would consist of at least No. 3 rebar at 18-inch center-to-center spacing, and include appropriate slab ties typically spaced at 54-inch centers. Proper reinforcement of slab-on-grade and moisture conditioning (i.e. pre-saturation) of upper 12 inches of subgrade soils prior to concrete placement will be particularly crucial due to the on-site expansive soils.

Final foundation design will depend on the final site grades relative to the expansive clay soils and should be determined in a design level report once additional information regarding the proposed development becomes available.

Preliminary Pavement Design

The surface and near-surface soils at the test pit locations exhibited moderate to good subgrade qualities for support of asphalt concrete pavements. Laboratory testing of two samples of near-surface soils indicate that these materials possess Resistance ("R") values of

30 and 51; as presented on Figures A4 and A5. We have conservatively used an R-value of 25 for preliminary design purposes for the calculation of alternative pavement sections.

The following preliminary pavement sections provided in Table have been calculated based on the R-value test results and a design life of 20 years. Traffic indices (TI) were selected consistent with the minimum requirements of Sacramento County.

TABLE 3
PRELIMINARY PAVEMENT DESIGN ALTERNATIVES

Traffic Index (TI)	Street Class Right-of-Way Width	R-value = 25	
		Type B Asphalt Concrete (inches)	Class 2 Aggregate Base (inches)
5.0	Residential Streets <54' Right-of-Way	2½	8
		3*	7
6.0	Residential Collector Street ≥54' Right-of-Way (no bus traffic)	2½	11
		3½*	9
6.5	Two lane commercial street with all bus routes	3	12
		4*	10
8.0	Arterial (84' Right-of-Way)	4	14
		5*	12

Note: *Asphalt thickness includes Caltrans Factor of Safety.

We emphasize that the performance of a pavement is critically dependent upon uniform compaction of the subgrade soils, as well as all engineered fill and utility trench backfill within the limits of the pavements.

Efficient drainage of all surface water to avoid infiltration and saturation of the supporting aggregate base and subgrade soils is important to the performance of pavements. Where drop inlets or other surface drainage features are to be constructed, weep holes could be provided at the base/subgrade level to allow free drainage of collected water, and reduce the potential of saturating the subgrade soils.

Future Geotechnical Engineering Study

Prior to final design and the start of construction, a design-level geotechnical engineering report must be prepared for this property that includes additional subsurface explorations and soil sampling, laboratory testing, and engineering evaluation. The final report should present geotechnical engineering conclusions and specific recommendations for site preparation, foundation design, floor support, retaining wall design, site drainage, and pavement design. When the project reaches this stage of development, we would be pleased to provide a proposal for these services.

LIMITATIONS

The findings and conclusions contained in this preliminary report are intended as a general overview of available geologic information combined with limited fieldwork and office analysis. We have used engineering judgment based upon the information provided and the data generated from the site reconnaissance, field exploration, and review of files for adjacent projects. We emphasize that this report is general in nature and intended for use in planning and budgeting for the project, and is applicable only to the investigated site.

This report has been prepared in substantial compliance with generally accepted geotechnical engineering practices that exist in the area of the project at the time the report was prepared. No warranty, either express or implied, is provided.

UNIFIED SOIL CLASSIFICATION SYSTEM

MAJOR DIVISIONS		SYMBOL	CODE	TYPICAL NAMES
COARSE GRAINED SOILS (More than 50% of soil > no. 200 sieve size)	GRAVELS (More than 50% of coarse fraction > no. 4 sieve size)	GW		Well graded gravels or gravel - sand mixtures, little or no fines
		GP		Poorly graded gravels or gravel - sand mixtures, little or no fines
		GM		Silty gravels, gravel - sand - silt mixtures
		GC		Clayey gravels, gravel - sand - clay mixtures
	SANDS (50% or more of coarse fraction < no. 4 sieve size)	SW		Well graded sands or gravelly sands, little or no fines
		SP		Poorly graded sands or gravelly sands, little or no fines
		SM		Silty sands, sand - silt mixtures
		SC		Clayey sands, sand - clay mixtures
FINE GRAINED SOILS (50% or more of soil < no. 200 sieve size)	SILTS & CLAYS LL < 50	ML		Inorganic silts and very fine sands, rock flour, silty or clayey fine sands or clayey silts with slight plasticity
		CL		Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
		OL		Organic silts and organic silty clays of low plasticity
	SILTS & CLAYS LL ≥ 50	MH		Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
		CH		Inorganic clays of high plasticity, fat clays
		OH		Organic clays of medium to high plasticity, organic silty clays, organic silts
HIGHLY ORGANIC SOILS		Pt		Peat and other highly organic soils
ROCK		RX		Rocks, weathered to fresh
FILL		FILL		Artificially placed fill material

APPENDIX A
Field and Laboratory Test Results

APPENDIX A

A. GENERAL INFORMATION

The performance of a preliminary geotechnical engineering study for the *Jaeger Ranch Property* located easterly of the intersection of Pericles Drive and Rancho Cordova Parkway in Rancho Cordova, California was authorized by Ms. Leah Dreger of The True Life Companies on August 9, 2016. Authorization was for a preliminary geotechnical study as described in our proposal letter dated August 2, 2016, sent to our client, The True Life Companies, whose mailing address is 12647 Alcosta Boulevard, Suite 470 in San Ramon, California 94583; telephone (925) 380-1699.

To assist in the preparation of this preliminary report, we have reviewed the Conceptual Site Plan, dated May 11, 2016, prepared by Wood Rodgers, Inc. of Sacramento, California.

B. FIELD EXPLORATION

We observed the site conditions and performed subsurface explorations at the site on August 16 and September 12, 2016. Field explorations consisted of excavating and sampling 10 test pits to depths of approximately 7 to 10½ feet below the existing surface grades. Soils exposed in the trenches were classified as required by the 2013 CBC in accordance with ASTM D2487 (USCS symbol shown on logs). Soil names and descriptions are reported using a modified system.

Test pits were completed by using a Case 580 Super M excavator and a 24-inch-wide bucket provided by Ron Tilford Backhoe of Orangevale, California. Relatively undisturbed soil samples were obtained at various intervals in selected test pits using a hand driven core sampler and California Sampler liners (1.875-inch-inside diameter). In addition, bulk samples were obtained from the test pits at various depths. \At the completion of exploration activities, the test pits were backfilled with excavation spoils, and compacted using a sheepsfoot compaction wheel.

The approximate locations of the test pits are provided in Figure 2. Descriptions of the soils encountered in the test pits are presented in Figures 3 to 12. An explanation of the Unified Soil Classification System symbols used in the soil descriptions is presented on Figure 13.

C. LABORATORY TESTING

Selected soil samples were tested to determine dry unit weight (ASTM D2937) and natural moisture content (ASTM D4643). The results of these tests are included on the boring logs at the depth each sample was obtained.

Selected representative samples of soils at the site were also tested to determine Atterberg limits (ASTM D4318) and grain-size distribution (gradation) (ASTM C136); the results are contained in Figures A1 and A2, respectively.

A sample of the near-surface soil was tested to evaluate shear strengths using a consolidated undrained with pore pressures triaxial test, commonly known as a CUPP triaxial test (ASTM D4767) with results presented in Figure A3.

Two representative samples of near-surface soil were subjected to Resistance “R” value testing (CT 301). The test results were used for pavement design purposes and are presented in Figure A4.

A sample of the near-surface soil was submitted to Sunland Analytical of Rancho Cordova, California, to determine the soil pH and minimum resistivity (California Test 643), Sulfate concentration (California Test 417, ASTM D516) and Chloride concentration (California Test 422). The results of these tests are presented in Figures A5 and A6.

Phase I Environmental Site Assessment
JAEGER RANCH PROPERTY
Southeast of the Intersection of
Douglas Road and Jaeger Road
Rancho Cordova, California
WKA No. 11103.01
September 22, 2016

Wallace-Kuhl & Associates (WKA), on behalf of the CLIENT, prepared this Phase I Environmental Site Assessment for the Jaeger Ranch Property located southeast of the intersection of Douglas Road and Jaeger Road, Rancho Cordova, California. We declare that, to the best of our professional knowledge and belief, both the report preparer and reviewer meets the definition of *Environmental Professional* as defined in §312.10 of 40 CFR 312 and has the "specific qualifications based on education, training, and experience to assess a *property* of the nature, history, and setting of the subject *property*. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312." Resumes of the key staff who prepared this report are included in Appendix A.

Phase I Environmental Site Assessment
JAEGER RANCH PROPERTY
WKA No. 11103.01

EXECUTIVE SUMMARY

The purpose of this Phase I Environmental Site Assessment (ESA) was to assess the Jaeger Ranch Property (herein referred to as site) for evidence of Recognized Environmental Conditions (RECs) resulting from current and/or former site activities. The Site is located approximately ½-mile southeast of the intersection of Douglas Road and Jaeger Road in Rancho Cordova, California (Figures 1, 2, 3, and 4) and is comprised of approximately 529 acres of undeveloped land having Sacramento County Assessor's Parcel Number (APN) 06-0040-008-0000 (Figure 3). The following presents a list of observations and findings identified during the preparation of this report:

The historical land use research dating back to the late 1800s revealed that the Site has remained largely undeveloped. Dry farming and livestock grazing appear to have been the historic land uses.

According to information provided by the User and JSR Vetting Services, LLC, no environmental liens are associated with the Site.

DRAFT

Based on the completion of the vapor encroachment condition (VEC) screening matrix, WKA concludes a VEC can be ruled out because a VEC does not or is not likely to exist.

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 for the Jaeger Ranch Property. Any exceptions to, or deletions from, this practice are described in Section 5.4 of this report. This assessment has revealed evidence of one RECs in connection with the Site.

The presence of perchlorate and TCE in groundwater under the Site constitutes a REC. The responsible party has been identified and ongoing groundwater treatment and monitoring is taking place with regulatory oversight provided by the CVRWQCB. Given the depth to water and soil conditions, it is unlikely that the TCE and perchlorate plume as currently understood will prohibit the proposed development. Periodic changes to the groundwater monitoring and remedial program may be required necessitating Site access for the purposes of monitoring well destruction and/or installation.

Phase I Environmental Site Assessment
JAEGER RANCH PROPERTY
WKA No. 11103.01

1.0 INTRODUCTION

1.1 Purpose

The purpose of this Phase I Environmental Site Assessment (ESA) was to evaluate the Jaeger Ranch Property (herein referred to as site) for evidence of potential Recognized Environmental Conditions (RECs) resulting from current and/or former site activities as defined by the American Society of Testing and Materials (ASTM) Standard E 1527-13 (ASTM, 2013).

According to the ASTM, "this practice is intended to permit a *user* to satisfy one of the requirements to qualify for the *innocent landowner*, *contiguous property owner*, or *bona fide prospective purchaser* limitations on CERCLA [Comprehensive Environmental Response, Compensation and Liability Act] liability (hereinafter, the "*landowner liability protections*," or "*LLPs*"): that is, the practice that constitutes "*all appropriate inquiry* into the previous ownership and uses of the *property* consistent with good commercial or customary practice" as defined at 42 U.S.C. §9601(35)(B)."

DRAFT

This ESA has been performed in general conformance with the ASTM Standard E 1527-13 and the scope and limitations defined in Wallace-Kuhl & Associates (WKA) proposal, 3PR16185, dated August 2, 2016.

1.2 Scope of Services

WKA has completed this ESA for the Site shown on Figures 1 through 3. Ms. Leah Dreger with The True Life Companies authorized WKA to proceed with this assessment on August 9, 2016 through a signed WKA Environmental Services Agreement.

The scope of this assessment included the following:

- Conduct a site reconnaissance for visual evidence of surface contamination and potential sources of subsurface contamination;
- Conduct a visual inspection of the adjoining properties for evidence of RECs
- Conduct interviews with the following, as available:
  - Key site manager,
  - Major occupants,
  - Past and present owners, operators,
  - Government and/or agency personnel, and,

  - Inquiries conducted at abandoned sites may include interviews with owners or occupants of neighboring or nearby properties;
- Conduct a records review, which included the following:
  - Physical setting documents to determine regional geology, general soil information, and local and regional groundwater conditions,
  - Historical information, including but not limited to, Sanborn maps, topographic maps, aerial photographs, ownership records, building department records, local street directories, zoning and land use records, and prior assessments, as available,
  - Environmental records, including federal, state, tribal, and county regulatory agency lists that will help identify RECs on the site and the adjoining properties, and,
  - Based on the outcome of the database search, review of specific regulatory agency files for identified contaminated facilities in order to evaluate whether the listed facilities are hazardous materials threats to the site;
- Conduct a preliminary screen for vapor encroachment conditions on the site per ASTM E2600-10;
- Review of the completed *ASTM E 1527-13 User Questionnaire* (*Questionnaire*) regarding Recorded Environmental Liens, activity and use limitations (AULs), relationship of the purchase price to the fair market value of the site, and any specialized knowledge of the site;
- Review of environmental liens and AULs reports, as provided; and
- Prepare a final report of the results of the ESA.

DRAFT

1.3 Special Terms and Conditions

No special terms or conditions to the WKA Professional Services Agreement or the WKA scope of services were requested or performed during the preparation of this report. The True Life Companies authorized WKA to perform a search for recorded environmental liens and Activity and Use Limitations (AULs) for the site. Discussion regarding the search is included in Section 4.3.5 of this report.

1.4 User Provided Information

WKA provided The True Life Companies a copy of the User Questionnaire and the Helpful Documents checklist. The True Life Companies returned the documents after they were completed by Ms. Leah Dreger, Director of Entitlements of The True Life Companies. Discussion regarding his responses is provided in the following section. A copy of the completed questionnaire is included in Appendix B.

In summary, Ms. Dreger was not aware of any records of environmental liens or AULs currently recorded against the Site. Ms. Dreger stated she does not possess specialized knowledge or experience related to the Site. Ms. Dreger stated that she is not aware of any obvious indicators that point to the presence or likely presence of contamination at the Site. Ms. Dreger was not aware of existing "Helpful Documents" as defined in Section 10.8.1 of the ASTM Standard as noted on the "Helpful Documents Checklist" included in Appendix B.

In addition, the User provided correspondence from First American Title Company stating that no environmental liens were recorded for the Site.

DRAFT

2.0 SITE DESCRIPTION

2.1 Site and Vicinity General Characteristics

The Site is located approximately ½-mile southeast of the intersection of Douglas Road and Jaeger Road in Rancho Cordova, California (Figures 1, 2, 3, and 4) and is comprised of approximately 529 acres of undeveloped land having Sacramento County Assessor's Parcel Number (APN) 06-0040-008-0000 (Figure 3).

2.2 Site Reconnaissance

A visual site reconnaissance was conducted by WKA on August 22, 2016. Figure 5 provides color photographs of the site taken during the site reconnaissance.

On the day of field reconnaissance the Site was generally undeveloped and covered by dry seasonal grasses. A dirt/gravel road extended south into the Site and terminated near a cluster of monitoring wells and a groundwater extraction feature (further described in Section 4.3 of this report). One soil stockpile was observed along the eastern portion of the northern Site boundary. No debris, stained soil, or distressed vegetation was observed in connection with this stockpile. The origin of this stockpile is discussed further in Section 3.1 of this report.

DRAFT

Small amounts of refuse were observed along then northern and western Site boundaries. Three modified tractor tires set up as livestock watering troughs were observed along the northern Site boundary. Each of these watering troughs, had water lines plumed utilizing PVC piping and valves. A metal water storage tank (approximately 1,5000 gallon capacity) was observed north of the groundwater extraction well located within the Site. At the time of our reconnaissance, the tank was determined to be empty by tapping on the sides. The welded placard on the side of the tank stated that it was originally built to be utilized as an underground storage tank. No abnormally distressed vegetation or soil staining was observed in the vicinity of the tank.

2.2.1 Municipal Infrastructure and Utilities

Two sets of high-voltage, tower-mounted electrical transmission lines cross the Site from northeast to southwest. Two sets of pole-mounted power lines also cross the Site in a parallel alignment. One concrete pad-mounted transformer was visible within the fenced enclosure containing the groundwater extraction well. Jaeger Road (portions closed) is located along the western Site boundary.

2.3 Adjoining Properties

The Site is bounded to the south and east by undeveloped land and to the north and west by residential subdivisions in various forms of completion.

3.0 INTERVIEWS

Interviews with various persons familiar with the site vicinity, including representatives of public agencies, were conducted for the purpose of identifying past and present uses, which may have contributed to RECs on the site. Results of those interviews are discussed in the following sections.

3.1 Owner or Key Site Manager

WKA interviewed Mr. Doug Dieter with K Hovnanian Homes regarding his knowledge of current and past Site activities. Mr. Dieter confirmed that K Hovnanian Homes owns the Site but stated that other than cattle grazing, he had no knowledge of the current or past Site use. Mr. Dieter stated that the soil stockpile along the northern Site boundary near the northeast corner was derived from the construction of the stormwater detention basin immediately north of the northeastern portion of the Site.

WKA provided The True Life Companies a copy of the User Questionnaire and the Helpful Documents checklist. The True Life Companies returned the documents after they were completed by Ms. Leah Dreger, Director of Entitlements of The True Life Companies. In summary, Ms. Dreger was not aware of any records of environmental liens or AULs currently recorded against the Site. Ms. Dreger stated she does not possess specialized knowledge or experience related to the Site. Ms. Dreger stated that she is not aware of any obvious indicators that point to the presence or likely presence of contamination at the Site. Ms. Dreger was not aware of existing "Helpful Documents" as defined in Section 10.8.1 of the ASTM Standard. Copies of the User Questionnaire and "Helpful Documents Checklist" are included in Appendix B.

DRAFT

3.2 Occupants (Multi-family or Major)

There are no occupants currently within the Site.

3.3 Past and Present Owners, Operators, and/or Occupants

No information regarding past owners was received by WKA during completion of this report.

3.4 State and/or Local Government Officials

WKA contacted, Sacramento County Environmental Management Department (SCEMD), regarding any regulatory files available for the site and surrounding facilities. According to SCEMD staff, the on-line document search option for their files will no longer be available. WKA submitted a public records request to review SCEMD files associated with the Site. At the time of completion of this report, our request had not been returned.

3.5 Abandoned Properties

As referenced in 40 CFR Part 312, in the case of inquiries conducted at "abandoned properties," as defined in §312.23(d), "where there is evidence of potential unauthorized uses of the site or evidence of uncontrolled access to the site, the environmental professional's inquiry must include interviewing one or more (as necessary) owners or occupants of neighboring or nearby properties from which it appears possible to have observed uses of, or releases at, such abandoned properties…" No evidence of potential unauthorized uses, or evidence of uncontrolled access to the site was observed. The site is not considered an abandoned property and therefore, WKA did not interview owners or occupants of neighboring properties.

DRAFT

4.0 RECORDS REVIEW

The purpose of the records review is to obtain and review information concerning the current and historical use of the site and adjoining properties that would help identify the presence of RECs in connection with the site. The records review included review and discussion of the following, as available:

- Physical Setting Source(s);
- Historical Use Information; and,
- Environmental Record Sources.

4.1 Physical Setting Source(s)

The Site is depicted on the 2012 United States Geological Survey (USGS) 7.5 Minute topographic map of the *Buffalo Creek, California Quadrangle* as undeveloped land. The Site is located within Section 16, Township 8 North, Range 7 East, Mount Diablo Base and Meridian, at an elevation of approximately +185 feet relative to mean sea level (msl).

DRAFT

4.1.1 Regional and Local Geology

The Site is located on the Great Valley geomorphic province of California, a large, elongate, northwest-trending structural trough, generally constrained to the west by the Coast Ranges and to the east by the foothills of the Sierra Nevada Range (Norris and Webb, 1990). The Great Valley consists of two valleys lying end-to-end, with the Sacramento Valley to the north and the San Joaquin Valley to the south.

The Sacramento and San Joaquin Valleys have been filled to their present elevations with thick sequences of sediment derived from both marine and continental sources. The sedimentary deposits range in thickness from relatively thin deposits along the eastern valley edge to more than 25,000 feet in the south central portion of the Great Valley (Norris and Webb, 1990). The sedimentary geologic formations of the Great Valley province vary in age from Jurassic to Quaternary, with the older deposits being primarily marine in origin. Younger sediments are continentally derived and were typically deposited in lacustrine, fluvial, and alluvial environments with their main source being the Sierra Nevada Range.

The 1965 USGS *Geologic Map of the Sacramento Quadrangle, California*, shows the Site to be underlain by the Plio-Pleistocene non-marine material.

4.1.2 Soil Survey

The United States Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS) has created a web-based service for accessing soil information. According to the NRCS Web Soil Survey (WSS) the majority of the near-surface soils on the Site consist of

Fiddyment fine sandy loam (0.5% of Site), Hicksville gravelly loam (2.4% of Site), Red Bluff-Redding complex (16.2% of Site), Redding loam (10.9% of Site), and Redding gravelly loam (70% of Site) (USDA, 2016). A copy of the soil report is included on the attached CD.

4.1.3 Regional and Local Groundwater

The Site is located within the California Department of Water Resources (DWR) defined Sacramento Valley Groundwater Basin/South American Sub-Basin of the Sacramento River Hydrologic Region. WKA searched data on the DWR website and found a DWR monitored groundwater wells approximately 1/8-mile northwest of the Site (Well No. 385571N12150W001). The most recent depth to groundwater measurement listed was 145 feet bgs on October 17, 2003 (DWR, 2016).

WKA also searched the State Water Resources Control Board's (SWRCB) GeoTracker website for quarterly groundwater monitoring reports completed for facilities in the immediate vicinity of the Site. A summary of the data associated with these facilities can be found in Section 4.3.1 of this report.

4.2 Historical Use Information

DRAFT

WKA reviewed historical information to develop a history of the previous uses of the site and surrounding area, in order to evaluate the site and adjoining properties for evidence of RECs. Standard historical sources reviewed during the preparation of this report included the following, as available:

- Sanborn® Maps;
- Topographic Maps;
- Oil and Gas Well Maps;
- Aerial Photographs;
- Ownership Records;
- Building Department Records;
- Local Street Directories;
- Zoning and Land Use Records;
- Other Historical Sources; and,
- Prior Assessments.

Discussion of these historical sources is provided in the following sections.

4.2.1 Sanborn® Maps

Sanborn® Maps with coverage of the site were obtained through Environmental Data Resources, Inc. (EDR®). EDR® is a national commercial provider of environmental database information. Sanborn® Maps are detailed drawings of site development, and were typically used

by fire insurance companies to determine site fire insurability. According to EDR®, Sanborn® Map coverage of the Site is not available (EDR®, 2016a).

4.2.2 Topographic Maps

Historical USGS topographic maps with coverage of the site and outlying land areas were reviewed. Topographic maps with coverage of the site dated 1891, 1892, 1893, 1908, 1916, 1941, 1944, 1954, 1967, 1975, 1980, and 2012 were available for review (EDR®, 2016b). Copies of the topographic maps compiled by EDR® with coverage of the site are included on the CD attached to the back cover of this report. Table 1 notes the changes in the vicinity of the site.

Table 1

Year	Scale	Observations
1891	1:125,000	The Site and surrounding parcels are vacant. Roads are mapped near the northern and western Site boundaries. A seasonal drainage is mapped crossing the western area of the Site flowing generally north to south
1892	1:125,000	No significant changes are mapped within the Site and surrounding parcels.
1893	1:125,000	No significant changes are mapped within the Site and surrounding parcels.
1908	1:31,680	With the exception of four small structures mapped within surrounding parcels, no significant changes are mapped within the Site and surrounding parcels.
1916	1:31,680	Several additional small structures are now mapped in the vicinity of the Site. No other significant changes are mapped within the Site and surrounding parcels.
1941	1:62,500	No significant changes are mapped within the Site and surrounding parcels.
1944	1:62,500	No significant changes are mapped within the Site and surrounding parcels.
1954	1:24,000	One well, a small reservoir and three small structures are mapped less than 1/8-mile north of the Site. No other significant changes are mapped within the Site and surrounding parcels.
1967	1:24,000	Two sets of tower-mounted electrical transmission lines are mapped crossing the Site from northeast to southwest. A cluster of medium and large structures are mapped approximately ½-mile north/northeast of the Site in the approximate present-day location of the Security Park industrial complex. A series of roads and structures are also visible approximately ½-mile north of the Site in the reported historic location of the McDonald Douglas testing facility.
1975	1:24,000	No significant changes are mapped within the Site and surrounding parcels.

DRAFT

Table 1		
Year	**Scale**	**Observations**
1980	1:24,000	No significant changes are mapped within the Site and surrounding parcels.
2012	1:24,000	Individual structures in the vicinity of the Site are no longer mapped. A large number of roadways are now mapped immediately north and west of the Site. These features are generally consistent with the present-day residential subdivisions located in the same areas.

4.2.3 Oil and Gas Well Maps

Review of California Department of Conservation, Division of Oil, Gas, and Geothermal Resources (DOGGR) website showed that the site is not located in a designated natural gas field. No DOGGR wells are located on or within at least one-mile of the site (DOGGR, 2016).

4.2.4 Aerial Photographs

Historical aerial photographs of the site and general vicinity were compiled by EDR®. Photographs covering the years 1937, 1952, 1957, 1964, 1966, 1972, 1984, 1993, 1998, 2005, 2006, 2009, 2010, and 2012 were available for review (EDR®, 2016c). Table 2 notes the changes on the property and in the vicinity.

DRAFT

Table 2		
Year	**Scale**	**Observations**
1937	1" = 1,000'	No Structures or improvements are visible within the Site. An apparent dirt road is visible along the western Site boundary.
1952	1" = 1,000'	Ground markings within the Site appear consistent with harvest patterns associated with dry land agricultural practices. Several small structures are visible within the immediate vicinity of the Site.
1957	1" = 1,000'	No significant changes are visible within the Site and surrounding parcels.
1964	1" = 1,000'	No significant changes are visible within the Site and surrounding parcels.
1966	1" = 1,000'	No significant changes are visible within the Site and surrounding parcels.
1972	1" = 1,000'	No significant changes are visible within the Site and surrounding parcels.
1984	1" = 1,000'	No significant changes are visible within the Site and surrounding parcels.
1993	1" = 1,000'	No significant changes are visible within the Site and surrounding parcels.
1998	1" = 500'	No significant changes are visible within the Site and surrounding parcels.

Table 2		
Year	**Scale**	**Observations**
2005	1" = 500'	Partially completed subdivisions are visible immediately north and west of the Site. No other significant changes are visible with the Site and surrounding parcels.
2006	1" = 500'	No significant changes are visible within the Site and surrounding parcels.
2009	1" = 500'	A winding dirt road is visible extending from the northern Site boundary into the northeastern portion of the Site. This dirt road is consistent with the access road terminating at the present-day groundwater extraction well located within the Site.
2010	1" = 500'	No significant changes are visible within the Site and surrounding parcels.
2012	1" = 500'	No significant changes are visible within the Site and surrounding parcels.

4.2.5 Ownership Records

According to a Preliminary Title Report for the site, the ownership entity is K. Hovnanian at Jaeger Ranch, LLC (First American Title Company, 2016).

Ownership information was obtained through ParcelQuest®, an on-line distributor of "Assessor-Direct property information throughout the State of California." The ownership entity for the site was listed as "K Hovnanian at Jaeger Ranch LLC" (ParcelQuest®, 2016).

DRAFT

4.2.6 Building Department Records

WKA contacted the City of Rancho Cordova, Community Development Department, Building & Safety Division and the County of Sacramento, Building Permits and Inspections Office regarding any permits recorded for the building. At the time of completion of this report, our request for records had not been returned.

4.2.7 Local Street Directories

Local street directories with coverage of the site and adjoining properties were obtained from EDR® (EDR®, 2016d). These documents contain business listings based on street number identifiers. The Site was not identified within the report. The surrounding parcels were identified as individuals. A copy of the EDR® City Directory (EDR®, 2016d) is provided on the CD attached to the back cover of this report.

4.2.8 Zoning and Land Use Records

WKA reviewed the Rancho Cordova Zoning and Future Land map dated December 2014. The Site is identified with the map as The Ranch at Sunridge (Proposed).

The Site is located within Federal Emergency Management Agency (FEMA), Flood Insurance Rate Map Number 06067C0240H dated August 16, 2012. A review of the map found that the Site is not located within a 100-year regulatory floodplain, as designated by FEMA.

4.2.9 Other Historical Sources

Review of additional historical sources was not warranted in order for the Environmental Professional to make a determination as to evidence of potential RECs on the site.

4.2.10 Prior Assessments

WKA was provided with no prior assessments associated within the Site.

4.3 Environmental Record Sources

4.3.1 Regulatory Agency Databases

DRAFT

EDR® was contacted to provide a summary of facilities listed on regulatory agency databases (EDR®, 2016e). Table 3 summarizes the researched ASTM required *Standard Environmental Record Sources*, as well as several *Additional Environmental Record Sources*, as defined in Sections 8.2.1 and 8.2.2 of the ASTM Standard. For additional reference, the Executive Summary of the EDR® report is included in Appendix C. A copy of the entire EDR® report is included on the CD attached to the back cover of this report.

DRAFT

Review of the EDR® report indicates the Site is not listed on any of the EDR® databases. Only one facility is detailed in the EDR® report and we summarize the facility information below.

The General Electric Medical Systems facility is located approximately ½-mile north/northeast of the Site with a street address of 3920 Security Park Drive. The facility has gone by multiple names including McDonnell Douglas and Security Park. The facility has been monitored and investigated for materials/waste management, handling, and disposal practices. No ongoing regulatory involvement is noted.

Multiple wells were observed within the northeastern area of the Site. A review of the State Water Resources Control Board's (SWRCB) GeoTracker website for quarterly groundwater monitoring reports completed for facilities in the immediate vicinity of the Site found that the

wells are a combination of monitoring wells and groundwater extraction wells associated with the Inactive Rancho Cordova Test Site (Former McDonnell Douglas Test Site) located less than 1-mile north of the Site. The constituents of concern include perchlorate and Trichloroethylene (TCE). Groundwater is being extracted and pumped to a treatment plan approximately 1-mile north/northwest of the Site. The monitoring wells were installed to verify the edge of the plume and monitor concentrations of the constituents of concern. The minimum depth to water in these wells is reported to have been 149 feet bgs.

WKA interviewed Mr. Alex McDonald of the Central Valley Regional Water Quality Control Board regarding sources of groundwater contamination within the former McDonnell Douglas facility. Mr. McDonald described two groundwater plumes originating from the former McDonnell Douglas facility approximately one-mile north of the Site. Mr. McDonald reports that both plumes are within a deeper aquifer and that a layer of clean water separates the contaminants from the ground surface. Mr. McDonald stated the clean water layer forms a barrier to vapor migration; hence, there are no vapor intrusions concerns related to the two plumes.

4.3.2 Preliminary Screen for Vapor Encroachment Conditions

DRAFT

WKA conducted a preliminary screening for vapor encroachment conditions (VEC) beneath the site using the Tier 1 vapor encroachment screening evaluation[1]. The Tier I screening included performing a *Search Distance Test* to identify if there are any known or suspect contaminated properties surrounding or upgradient of the site within specific search radii, and a *Chemicals of Concern (COC) Test* (for those known or suspect contaminated properties identified within the *Search Distance Test*) to evaluate whether or not COC are likely to be present. The Vapor Encroachment Screening Matrix is included in Appendix D.

Based on the completion of the VEC-screening matrix, a VEC can be ruled out because a VEC does not or is not likely to exist.

EDR® was contacted to provide a Vapor Encroachment Screen for the site (EDR®, 2016f). No areas of concern were identified.

4.3.3 Environmental Lien Search

According to an August 25, 2016 Environmental Lien Search Report prepared by JSR Vetting Services, LLC, no environmental liens or activity or use limitations (AULs) were recorded for the site. A copy of the Environmental Lien Search Report is included on the CD attached to the back cover of this report.

[1] The Preliminary Screen for Vapor Encroachment Conditions was based on the guidelines presented in the ASTM *E 2600-10 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions*.

5.0 CONCLUSIONS AND RECOMMENDATIONS

5.1 Data Gaps

WKA identified the following data gaps during the completion of this report:

- The time intervals between the Standard Historical Sources (i.e., topographic maps, aerial photographs, other historical sources) exceeded the ASTM minimum five-year period. However, the use of the site appears unchanged within the time gaps, and therefore, research of the site use during the time gaps is not required by the ASTM Standard (Refer to *Section 8.3.2.1 – Intervals* of the ASTM E 1527-13 standard).

- SCEMD staff, the on-line document search option for their files will no longer be available. WKA submitted a public records request to review SCEMD files associated with the Site. At the time of completion of this report, our request had not been returned.

- WKA contacted the City of Rancho Cordova, Community Development Department, Building & Safety Division and the County of Sacramento, Building Permits and Inspections Office regarding any permits recorded for the building. At the time of completion of this report, our request for records had not been returned.

DRAFT

It is the opinion of WKA that no significant data gaps were identified during the preparation of this report that affects the ability of the Environmental Professional to identify RECs on the site.

5.2 Conclusions

The historical land use research dating back to the late 1800s revealed that the Site has remained largely undeveloped. Dry farming and livestock grazing appear to have been the historic land uses.

According to information provided by the User and JSR Vetting Services, LLC, no environmental liens are associated with the Site.

Based on the completion of the vapor encroachment condition (VEC) screening matrix, WKA concludes a VEC can be ruled out because a VEC does not or is not likely to exist.

We have performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 for the Jaeger Ranch Property. Any exceptions to, or deletions from, this practice are described in Section 5.4 of this report. This assessment has revealed evidence of one RECs in connection with the Site.

The presence of perchlorate and TCE in groundwater under the Site constitutes a REC. The responsible party has been identified and ongoing groundwater treatment and monitoring is taking place with regulatory oversight provided by the CVRWQCB. Given the depth to water and soil conditions, it is unlikely that the TCE and perchlorate plume as currently understood will prohibit the proposed development. Periodic changes to the groundwater monitoring and remedial program may be required necessitating the abandonment and installation of wells may be required.

A full copy of this ESA report, in a .pdf format, is included on the attached CD.

5.3 Recommendations

Based on the conclusions presented and the documentation contained herein, WKA recommends that the Site owner maintain contact with the CVRWQB on a semi-annual basis so as to understand the current remedial and monitoring status of the perchlorate and TCE plume under the Site and to properly plan for proposed modifications to the monitoring and treatment program.

DRAFT

5.4 Exceptions and/or Deletions

With the exception of the data gaps identified in Section 5.1 of this report, no exceptions or deletions from the ASTM E 1527-13 standard were made during the performance of this ESA.

5.5 Additional Services

Non-scope considerations, such as assessment for naturally occurring asbestos (NOA), wetlands evaluation, indoor air quality, laboratory testing of the soils and groundwater beneath the site for environmental contaminants (such as agricultural-related pesticides, termiticides, polychlorinated biphenyls [PCBs], or arsenic and lead), and assessments for asbestos containing materials and lead-based paint were not included or requested as part of this ESA. Additionally, this ESA included conducting a Tier 1 vapor encroachment screening in accordance with the ASTM *E 2600-10 Vapor Encroachment Screening on Property Involved in Real Estate Transactions.*

6.0 LIMITATIONS

The statements and conclusions in this report are based upon the scope of work described above and on observations made only on the date of the field reconnaissance, August 22, 2016. Work was performed using a degree of skill consistent with that of competent environmental consulting firms performing similar work in the area. Information regarding the site that is *publicly available* and *practically reviewable,* as described in the ASTM standard, was obtained. Additional research or receipt of information regarding the site that was not disclosed or available to WKA during this assessment may result in revision of the conclusions. The conclusions in this report should be reevaluated if site conditions change. No recommendation is made as to the suitability of the site for any purpose. The results of this assessment do not preclude the possibility that materials currently or in the future defined as hazardous are present on the site, nor do the results of this work guarantee the potability of groundwater beneath the site. This report is applicable only to the investigated site and should not be used for any other property. No warranty is expressed or implied.

This report is viable for one year from the publication date of the report provided the following components are updated within 180 days of the date of purchase or (for transactions not involving an acquisition) the date of the intended transaction:

- Interviews with current owners/occupants and/or in order to identify changes in site conditions or uses since the publication date of this report
- Searches for recorded environmental cleanup liens
- Visual inspection of the site and of adjoining properties with emphasis on changes in conditions or uses since the publication date of this report
- A current review of federal, state, tribal and county databases
- The declaration by the environmental professional responsible for the assessment.

Environmental Site Assessments completed more than one year prior to the date of purchase must be reviewed and updated in order for the *Environmental Site Assessment* to be considered valid per Section 4.6 (*Continued Viability of Environmental Site Assessment*), and Sections 4.7 and 8.4 (*Prior Assessment Usage*) of the ASTM E 1527-13 Standard.

APPENDIX A
RESUMES

DRAFT

Wallace Kuhl & Associates

BRYAN C. YATES

ENVIRONMENTAL SPECIALIST

Bryan C. Yates has managed projects dealing with multiple aspects of private and public development including master-planned communities, residential subdivisions, schools, churches, commercial properties, and light industrial facilities since 1998.

At Wallace Kuhl & Associates, Mr. Yates provides consulting services for multiple disciplines including:

- Stormwater Pollution Prevention Plans
- Municipal Stormwater Management Planning/Permitting
- Environmental Site Assessments
- Geotechnical Feasibility Studies
- Construction Management
- Land Development Consultation
- Land Development Constraints Analysis
- Political Consulting/Public Agency Interaction

SELECTED PROJECT EXPERIENCE

Castle Farms, Merced, CA: Mr. Yates prepared a Phase I Environmental Site Assessment, assisted in the geotechnical feasibility study, planned and coordinated a ground water assessment, which included an aquifer pumping test. His work also included quarterly surface water and air monitoring that continued for three years. Castle Farms consists of approximately 2,500 acres of agriculture production land formerly used for growing almond and wine grapes crops. The property is surrounded by a chicken ranch, a former military installation a Class III Disposal Landfill and a dairy farm.

Leona Quarry, Oakland, CA: Mr. Yates coordinated the efforts of multiple members of the development and construction team with local and regional agencies. He assisted in the preparation of the Stormwater Management Plan and SWPPP for this reclaimed quarry located in the Oakland Hills. Re-use planning revolved around approximately 400 condominium and single-family residential lots within the former quarry. Leona Quarry was an aggregate mine in Alameda County, California that was undergoing closure/re-use Studies.

.

North Spring Street Bridge Widening Project, Los Angeles, CA: Mr. Yates completed, an Initial Site Assessment in general conformance with Caltrans Standard Environmental Reference. The proposed project would widen the existing 50-foot-wide viaduct by approximately 20 feet on each side, resulting in a 90-foot-wide by 700-foot-long viaduct the California Department of Transportation and the City of Los Angeles had voiced concerns over the hazardous materials impacts by the proposed project during the NEPA/CEQA environmental documentation process.

Sacramento Stucco Property, West Sacramento, CA: Mr. Yates completed a Phase I Environmental Site Assessment for the three-acre property located northwest of the intersection of Riske Lane and South River Road and assisted in getting the Property through the enrollment process for the VCA program with the DTSC.. The property was occupied by the active Sacramento Stucco Company operation. Development plans for the property include a 30- to 50-story building occupied by commercial space, a parking structure, and approximately 300 condominiums. This Brownfield property currently lies within the redevelopment zone identified by the City of West Sacramento. The property was historically occupied by a lead acid battery recycling operation,

Transcan/Hillcrest Area Specific Plan, Antioch, CA, Mr. Yates completed a modified Environmental Site Assessment in support of the initial planning land acquisition activities for this proposed 375-acre transit oriented development. Mr. Yates also assisted the project proponent in completing an opportunities and constraints analysis for the project. The project is planned for a multi-facetted transit oriented development with a town center, 2,500 high density residential units, and no single family residences. Initial planning was complicated by a mix of historic agriculture and industrial uses that will be mitigated throughout the development process.

Folsom Boulevard Streetscape, Rancho Cordova, CA, Mr. Yates completed multiple Phase I Environmental Site Assessments in support of the efforts by the City of Rancho Cordova to upgrade and revitalize the five-mile Folsom Boulevard Corridor. These assessments were completed as part of the technical studies for project NEPA/CEQA documentation and compliance. The

DRAFT

Wallace Kuhl & Associates

BRYAN C. YATES

Folsom Boulevard corridor is the heart of the City of Rancho Cordova Redevelopment Zone. Special features within the corridor include 4 Sacramento Regional Transit Light Rail Stations, and 3 Park & Ride Lots. Two US EPA Superfund sites are located within one mile of the Project boundary.

Northeast Fairfield Specific Plan, Fairfield, CA, Mr. Yates completed a hazardous materials assessment study for this large master planned community. This project included the development of previously undeveloped land, the redevelopment of the Cement Hill industrial area, a transit village with Capitol Corridor service, a railroad grade separation, and redevelopment of former railroad facilities. The planned uses included more than 6,000 single family residences, an employment center, retail, warehouse, and commercial.

Livingston's Concrete Services, Multiple Locations, CA, Mr. Yates has provided stormwater consulting services for Livingston's Concrete Services facilities in Lincoln, Rancho Cordova, North Highlands, Marysville, and Ophir (proposed).

Sunset, Roseville, CA, The Sunset project consists of approximately 1,000 acres of cattle grazing land. Mr. Yates completed a Phase I Environmental Site Assessment for this project. He also facilitated domestic water services discussions between Placer County Water Agency, the City of Roseville, and the project proponent.

Church Street Subdivision, Half Moon Bay, CA, Mr. Yates completed several technical studies in support of the environmental planning and permitting of this residential infill project located within Half Moon Bay, California. Bryan completed a modified Phase I Environmental Site Assessment that included soils sampling and analysis, preliminary drainage study. The environmental sampling was completed as a screening tool to assess the potential for pesticides residues to be present in near surface soil of the site. The preliminary drainage study was complicated by dense riparian vegetation along the banks of Pilarcitos Creek, floodplain issues, and the potential need to realign the stream channel to accommodate for the potential of an upstream earthen dam failure.

Solano County Fairgrounds Redevelopment, Vallejo, CA, Mr. Yates completed a modified Phase I Environmental Site Assessment in support of the initial planning phase of the proposed redevelopment of this 180 acre existing county fairgrounds site. Large areas of undocumented fill, underground fuel storage tanks, animal disposal pits, lead/asbestos, PCBs, and animal waste in shallow groundwater were all issues identified in the initial phases of the assessment.

Stockton Waterfront Project, Stockton, CA, Mr. Yates was Project Manager for the approximately 70-acre designated Brownfield project. This site was the location of the Colberg Boat Works that had historically been used to build and repair mine sweeping ships during World War II and more recently had been utilized for a variety of industrial activities. Bryan completed the Phase I Environmental Site Assessment for this complex waterfront project. The project will encompass 69 single-family, waterfront residences with internal streets, underground utilities, landscaping, and clubhouse.

KURT M. BALASEK

SENIOR HYDROGEOLOGIST/DIRECTOR OF ENVIRONMENTAL SERVICES

Mr. Balasek has provided a leadership role in hydrogeologic and environmental consulting in the Western US. since 1989. His experience includes, residential and commercial land development, litigation support, permitting, regulatory compliance and technical team building. Mr. Balasek and his team have conducted a wide range of impacted soil and groundwater investigations, mine location and reclamation activities, water resource evaluations and conjunctive use studies. Mr. Balasek has supported municipal efforts to redevelop blighted neighborhoods using private and federal funding and has prepared successful grant applications for EPA Brownfield funding. Mr. Balasek has facilitated public stakeholder processes, organized public comments and used the information gathered from these efforts to prioritize neighborhood and regional site investigations and remedial activities.

Mr. Balasek specializes in unique approaches to problem solving and leverages nearly 30 years of regulatory relationships to assist clients facing enforcement actions. Mr. Balasek has saved his clients hundreds of thousands of dollars in reduced fines, monitoring requirements or realized project efficiencies.

SELECTED PROJECT EXPERIENCE

DRAFT

Stockton Worknet, Stockton, CA: Project was conducted for the City of Stockton Redevelopment Agency and involved delineation, removal and disposal for hydrocarbon and lead-contaminated soil discovered during a construction project. The project also involved a component of public outreach because a children's museum was located immediately adjacent to the site.

Hayden Hill Mine, Lassen, CA: Project consisted of third party review of mine closure plan for Lassen County. Provided technical assistance to Lassen County Planning Commission to facilitate permanent closure of large open pit mine.

Willow Creek, Folsom, CA: Project involved site investigation and subsequent removal of petroleum hydrocarbon-contaminated soil to facilitate private development of commercial property. Under my direction, I facilitated the investigation, excavation and coordination of closure petitions.

City of West Sacramento, West Sacramento, CA: Multiple Projects. These projects involved initial site evaluation of several hundred individual sites for the redevelopment of West Sacramento. Subsequent work involved site investigation and remediation of several sites under U.S. EPA Grants. Provided technical assistance to City staff and collaborated with them to best utilize the public funds and coordinate public outreach.

Rominger Property, Winters, CA (on-going): This project involves detailed site investigation, hydrogeologic analysis and evaluation, and the selection of appropriate remediation technologies for a large plume of (MTBE) contamination on an Ag-industrial site. Project involvement included client and regulatory interaction.

ASTM E 1527-13 User Questionnaire
and Helpful Documents Checklist

DRAFT

E 1527-13 USER QUESTIONNAIRE
JAEGER RANCH PROPERTY

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"), the *user*[2] must provide the following information (if available) to the *environmental professional*. Failure to provide this information could result in a determination that "*all appropriate inquiry*" is not complete.

(1.) Have you performed a search for environmental cleanup liens and AULs, as described under *User Obligations* in the attached proposal, for the *property*? No

(2.) Are you aware of any environmental cleanup liens against the *property* that are filed or recorded under federal, tribal, state or local law? No

(3.) Are you aware of any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law? No

(4.) As the *user* of the report, do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

(5.) Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present on the *property*? The price reasonably reflects the fair market value No known information regarding contamination affects price.

(6.) Are you aware of commonly known or reasonably ascertainable information about the *property* that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,

(a.) Do you know the past uses of the *property*? If so, what were they?
No, but likely cattle grazing.

(b.) What, if any, specific chemicals are present or once were present at the *property*?

Unknown

[2] User, as defined in the ASTM Standard is "the party seeking to use Practice E 1527 to complete an environmental site assessment of the property. A user may include, without limitation, a potential purchaser of property, a potential tenant of property, an owner of property, a lender, or a property manager. The user has specific obligations for completing a successful application of this practice as outline in Section 6 [of the ASTM Standard]."

DRAFT

E 1527-13 USER QUESTIONNAIRE (cont.)
JAEGER RANCH PROPERTY

Questions 6 continued:

(c.) What, if any, spills or other chemical releases have taken place at the *property*?

Unknown

(d.) What, if any, environmental cleanups have taken place at the *property*?

Unknown

(7.) As the *user* of this ESA, based on your knowledge and experience related to the *property* are there any obvious indicators that point to the presence or likely presence of contamination at the *property*?

Unknown

COMPLETION:

I have completed this User Questionnaire to the best of my knowledge and provided all information to the environmental professional as of the following date:

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 12/09/2015 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
GENERAL ELECTRIC MED	***3920 SECURITY PARK D***	***NNE 1/2 - 1 (0.624 mi.)***	***A2***	***9***

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

HWP: Detailed information on permitted hazardous waste facilities and corrective action ("cleanups") tracked in EnviroStor.

A review of the HWP list, as provided by EDR, and dated 05/23/2016 has revealed that there is 1 HWP site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
GENERAL ELECTRIC MED EPA Id: CAD000819680 Cleanup Status: CLOSED	3920 SECURITY PARK	NNE 1/2 - 1 (0.624 mi.)	A1	8

DRAFT

APPENDIX D

Preliminary Screen for Vapor Encroachment Conditions Matrix

DRAFT

Screen for Vapor Encroachment Conditions Matrix
Jaeger Ranch Property
WKA No. 11103.01

Phase I ESA Screen for Vapor Encroachment Conditions (VEC) matrix includes a (1) **Search Radius Test,** (2) **Chemicals of Concern Test (COC),** and (3) a **Critical Distance Test**[1].

(1) Search Radius Test: Are there any known or suspect contaminated sites in the primary area of concern within the corresponding search radii? (if yes, see attached Table A).

(Yes) No If No, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If Yes, then:

(2) **Chemicals of Concern**[2] **Test**: Are COC likely to be present within the area of concern for those known or suspect contaminated sites identified based on the Search Distance Test?

(Yes) No If No, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If Yes, then:

If Yes, check all COC that apply on attached Table B.

(3) Critical Distance Test: A plume test to determine whether or not COC in the contaminated plume(s) may be within the critical distance.

(3a) Is information related to the contaminated(s) plume available (i.e. isoconcentration maps, site drawings, etc.)?
(Yes) No

(3b) If ***No***, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If ***Yes***, then:

(3c) Is the site less than 100 feet to the nearest edge of a contaminated [non-petroleum hydrocarbon] plume(s)?
(Yes) No

(3d) Is the site less than 30 feet to the nearest edge of a dissolved petroleum hydrocarbon plume(s)?
(Yes) No

DRAFT

If the distance from the nearest edge of a contaminated plume to the nearest existing or planned structure on the site is less than 100 feet for non-petroleum hydrocarbon COC, or less than 30 feet for dissolved petroleum hydrocarbons, then it is presumed that a VEC *currently* exists beneath the site. If the distance from the nearest edge of the contaminated plume is greater than or equal to 100 feet for non-petroleum hydrocarbons, or 30 feet for dissolved petroleum hydrocarbon chemicals of concern, then it is presumed unlikely that a VEC *currently* exists beneath the site.

(4) Is it likely that a VEC *currently* exists beneath the site?
Yes (No) If *Yes,* then recommend performing a full scope VEC assessment according to ASTM E 2600-10.

[1] Based on guidance presented in the ASTM E 2600-10 Standard.
[2] Chemical(s) of concern (COC): See attached table for typical chemicals of concern (as presented in Appendix X6.1 of the ASTM E 2600-10 Standard).

APPENDIX G

The Ranch Project Consistency with Rancho Cordova General Plan Policies

APPENDIX G: THE RANCH PROJECT CONSISTENCY WITH RANCHO CORDOVA GENERAL PLAN POLICIES

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
LAND USE	
Policy LU.1.3 – Maintain a strong jobs-housing ratio, with a diverse job base and corresponding housing stock, within the Planning Area. Improve the relationship and proximity of jobs to housing and commercial services. (Further implemented through Action LU.1.3.2)	**Consistent.** As described in Section 3.11, the project is generally consistent with the City's General Plan in regards to the mix of residential and nonresidential land uses. Additionally, the project area includes retail and commercial uses interspersed with residential uses as envisioned for the SunCreek/Preserve Planning Area; thereby providing jobs within proximity to housing consistent with the General Plan. Further, the future employment growth associated with the project is consistent with the growth anticipated in the SACOG 2016 MTP/SCS.
Policy LU.1.4 - Promote high quality, efficient, and cohesive land utilization that minimizes negative impacts (e.g., traffic congestion and visual blight) and environmental hazards (e.g. flood, soil instability) on adjacent neighborhoods and infrastructure and preserve existing and future residential neighborhoods from encroachment of incompatible activities and land uses.	**Consistent.** The proposed project has been designed to minimize congestion, visual imposition, and environmental hazards between adjoining, but different land uses, as discussed in The Ranch Draft EIR.
Policy LU.1.6 Ensure adequate provisions for development of civic uses (public/quasi-public). (Further implemented by Action LU.1.6.1).	**Consistent.** The proposed project includes the public uses including park and recreation facilities, trails, and a recreation center.
Policy LU.1.7 – Promote higher density and intensity land uses that support transit within one- half mile of major transit stations. Development should be pedestrian- and transit-friendly with direct connections to transit. Large, expansive parking fields that separate the retail from the station are prohibited.	**Consistent.** The project is not located within one-half mile of a major transit station. The project includes multifamily development near the proposed retail and commercial areas and locates the higher intensity land uses (268 multifamily units and approximately 5 acres of commercial uses) associated with the project in close proximity to the planned Signature Transit Line facility.
Policy LU.1.9 - The City shall require development to protect one acre of existing farmland of equal or higher quality for each acre of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance that would be converted to non- agricultural uses. This protection may consist of the establishment of farmland conservation easements, farmland deed restrictions, or other appropriate farmland conservation in perpetuity, but may also be utilized for compatible wildlife conservation efforts. The farmland to be preserved shall be located within Sacramento County and must have adequate water supply to support agricultural use. As part of the consideration of land areas proposed to be protected, the City shall consider the benefits of preserving farmlands in proximity to other protected lands.	**Consistent.** The majority of the project site is depicted on the California Department of Conservation's Farmland Mapping and Monitoring Program as Grazing Land, with some portions of the site depicted as Urban and Built-Up Land. Grazing Land is suitable for the grazing of livestock and does not qualify as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. Therefore, no protection of existing farmland is required and the proposed project is consistent with this policy.
Policy LU.1.11 – Proper buffering for the Kiefer landfill of a 2,000-foot buffer around the permitted footprint of the landfill shall be required. Where appropriate, land use density, buffers, or other measures should be used when planning future land uses near the landfill.	**Consistent.** No portion of the project site falls within 2,000 feet of the land fill footprint.
Policy LU.2.1 - Ensure future land use and growth within the Planning Area adheres to the City's smart growth principles, as described in this Element.	**Consistent.** The proposed project impacts the applicable Smart Growth Principles as follows: *Transportation Choices* - In addition to major and minor roads planned throughout the project, the project would provide an on-site transit facility consistent with the

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
	City's Transit Master Plan. Additionally, the project has proposed pedestrian/bicycle path network for the site. *Housing Choices* - The proposed project includes a mix of medium and low-density residential land uses, including age-restricted and non-age restricted, providing choices for future residents in the area of density and ultimately home size and price. *Mixed Land Uses* - The proposed project includes residential, commercial, parks, and recreation land uses. *Compact Urban Development* - The proposed project is designed with commercial land uses surrounded by residential uses and connected by both roads and pedestrian/bicycle paths and has clustered uses in order to avoid the large, continuous nature preserve that would be established by the project. Neighborhoods within the proposed project are consistent with the building blocks concept of the City and are therefore clustered and compact. *Walkable Neighborhoods* - Residential land uses in the proposed project are clustered, fostering a walkable community and serving to create compact residential areas. In addition, the project will include sidewalks, off-street trails, standard pedestrian crossing warning signs, signs to identify pedestrian and bicycle paths, and pedestrian signal heads. Sidewalks will be constructed as part of the frontage improvements along all new roadway construction for Jaeger Road/Rancho Cordova Parkway and Chrysanthy Boulevard. *Preservation/Integration of Natural Resources* - The proposed project includes an approximate 199.5-acre preserve. The project would also include additional park and open space associated with project drainage improvements and public trails. *Quality Design/Sense of Place* - The final design of structures within the proposed project will be subject to the The Ranch Special Planning Area Handbook (SPA Handbook), which has been developed to provide a cohesive community with high quality design.
Policy LU.2.2 - Promote new development and redevelopment in accordance with the building blocks concepts of neighborhoods, villages, and districts.	**Consistent.** The project is designed in accordance with the building blocks concept to include cohesive neighborhoods.
Policy LU.2.4 – Use Community Plans, Proposed projects, and development projects to promote pedestrian movement via direct, safe, and pleasant routes that connect destinations inside and outside the plan or project area.	**Consistent.** The project includes ample bicycle and pedestrian trails throughout the project site. The project provides a well detailed plan for internally pleasant travel as well as for connection with external routes.
Policy LU.2.5 - Phase growth based on infrastructure capacity, infrastructure financing, and the timing of the design, approval/permitting, and construction of transportation facilities and other infrastructure.	**Consistent.** The project includes a phasing plan. The project is to be accomplished in four phases. These four phases are designed to match the construction of infrastructure.

APPENDIX G: THE RANCH PROJECT CONSISTENCY WITH RANCHO CORDOVA GENERAL PLAN POLICIES

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy LU.2.6 - Discourage the over concentration of retail shopping facilities in a single location in order to ensure neighborhood services are distributed and integrated into the City's neighborhoods and that market demand is met without diminishing the viability of nearby commercial properties with the same customer base. Further implemented by Action LU.2.6.1.	**Consistent.** The project implements the building block approach in conjunction with the provision of a neighborhood-serving commercial parcel. The commercial parcel is sized appropriately for the area and would not result in an over concentration of retail uses.
Policy LU.2.7 – Promote sustainable development that reduces the impact of projects on energy, water, and transportation systems. Encourage sustainable development to occur in ways that complement the built form.	**Consistent.** The proposed project integrates sustainable development practices at each level of community planning and implementation. See Section 3.6 (Greenhouse Gases, Climate Change, and Energy) of The Ranch Draft EIR for a description of the project's design measures as well as mitigation requirements that reduce energy consumption, water use, reduce vehicle trips, reduce GHG emissions, and promote sustainable development.
Policy LU.3.4 - Consult with state and federal regulatory and resource agencies during initial review of development projects to identify potential environmental conflicts and establish, if appropriate, concurrent application processing schedules.	**Consistent.** The proposed project is subject to CEQA review. A Notice of Preparation (NOP) to prepare an EIR was published for this project. State and federal regulatory and resource agencies had the opportunity to provide comments based on this initial notice and will also be notified and provided the opportunity to comment during the public review period for The Ranch Draft EIR.
Policy LU.3.5 - Work with community service providers such as the Cordova Recreation and Park District and the Rancho Cordova Neighborhood Center to expand their services to new areas of the City as opportunities arise.	**Consistent.** Plan development, including location and sizing of parks, has been coordinated with the Cordova Recreation and Park District.
Policy LU.3.9 - Ensure that land uses adjacent to or near Mather Airport are subject to the location, use, and height restrictions of the most recently adopted CLUP/ALUP at the time of development consideration, except when the CLUP/ALUP is under an update process. In the circumstance of a CLUP/ALUP update, coordinate with the County in the review of development projects to determine the most appropriate development restrictions for the continued operation of the airport.	**Consistent.** The proposed project area is not located within the Airport Area of Influence. Therefore, the CLUP guidelines and restrictions on development do not apply to the proposed project or any of the alternatives.
Policy LU.6.2 – Ensure subsequent detailed land planning for those Planning Areas with Conceptual Land Plans.	**Consistent.** The proposed project provides a detailed land use plan in the SPA Handbook, including land use designations, proposed land uses depicted on a land use map, and policies and details regarding development standards and allowed uses.
URBAN DESIGN	
Policy UD.1.1 – Promote the design of residential neighborhoods in accordance with the desired character of the village and district in which it is located. All City codes and regulations shall be updated to reflect the City's vision for Urban Design neighborhoods, villages, and districts as the building blocks of the City.	**Consistent.** The Rancho Cordova General Plan currently designates the project site as the SunCreek/Preserve Planning Area. As part of the proposed project, the applicant is requesting a General Plan Amendment to establish specific General Plan land use designations, LDR, MDR, HDR, C, P/OS, and NR in order to implement the General Plan's land use concept for the project's portion of the SunCreek/Preserve Planning Area. The proposed project has been designed to incorporate the development directives and conform with the expectations described in the Rancho Cordova General Plan.

APPENDIX G: THE RANCH PROJECT CONSISTENCY WITH RANCHO CORDOVA GENERAL PLAN POLICIES

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy UD.1.3 - Design neighborhoods as walkable places, approximately 1/3 mile in radius, and connected to adjoining neighborhoods by trails, open spaces, and commercial activity nodes.	**Consistent.** The site plan for the proposed project illustrates that no community is more than 1/2-mile wide, and is planned to be developed in neighborhood phases that are at most 1/4-- to 1/3--mile wide. The proposed neighborhoods would be connected to adjoining neighborhoods by trails, open spaces, and the proposed commercial area.
Policy UD.1.4 - Design residential subdivisions with a mix of housing types and densities that satisfy a wide range of lifestyles and income levels. (Further implemented by Actions UD.1.3.1, UD.1.3.2 and UD.1.3.3)	**Consistent.** The proposed project contains many different housing types that would be utilized in the community.
Policy UD.1.5- Develop vibrant urban cores (village centers and local town centers) as the primary activity centers of each district within the City.	**Consistent.** The proposed project includes two commercial sites at the intersection of Chrysanthy Boulevard and Rancho Cordova Parkway. These areas are intended to serve as a local town center, with retail and commercial uses providing products and services to the surrounding residents.
Policy UD.1.6 - Encourage the design of village and local town centers as pedestrian- and cyclist- friendly activity centers with successful public spaces.	**Consistent.** This is accomplished by the overall design approach with an emphasis upon proximity to open space and limiting conflict between the automobile and the pedestrian and bicyclist. The commercial areas are located along Rancho Cordova Parkway and Chrysanthy Boulevard, which will have pedestrian and bicycle access routes included.
Policy UD.2.1 - Require new development and redevelopment areas to be designed in accordance with the City's building blocks concept.	**Consistent.** See response to Policy LU.2.6 (below).
Policy UD.2.6 - Create streetscape designs with themes that are oriented toward and inviting to pedestrians and cyclists and that are unique in character to a district, corridor, or area within the City.	**Consistent.** The proposed project includes an extensive network of pedestrian trails and paths (See discussion under Policy LU.2.4 above) as well as bicycle lanes and paths. The proposed project includes details on the design and location of these paths, providing a unique visual character.
Policy UD.3.1 – Ensure quality design of new development and redevelopment with an integrated architectural style.	**Consistent.** The proposed Architectural + Site Design Guidelines (included in the SPA Handbook) for multifamily and commercial uses include guidance as to the architectural design of buildings in the project area, thereby establishing a cohesive style for the project area. The architectural design of the single-family residential areas is also guided by the proposed SPA Handbook.
Policy UD.3.2 - Create safe, inviting, and functional pedestrian and cyclist environments in commercial, office, and mixed-use projects.	**Consistent.** The proposed project creates an interconnected and multi-modal transportation network and provides a hierarchical interconnected street system with streets as inviting, multi-modal public spaces. Various modes of transportation including an intricate pedestrian and bicycle trail network will reduce automobile dependency. Additionally, the entire pedestrian system will provide access to meaningful destinations like commercial centers, schools, and parks on the project site and off-site.
Policy UD.3.3 - Promote the incorporation of public spaces and pedestrian amenities into all commercial and mixed-use projects.	**Consistent.** This is accomplished by the overall design approach with an emphasis upon proximity to open space and limiting conflict between the automobile and the pedestrian and bicyclist. Extensive public space, including active and passive parks, open space, and a trail system, is included in the proposed project.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy UD.4.2 - Design new development to be compatible with surrounding development in ways that contribute to the desired character of the City and District.	**Consistent.** The urban development on the project site would be consistent with, and appear as a continuation of, development in the subdivision to the north and west and future development in the area to the south and east.
ECONOMIC DEVELOPMENT	
Policy ED.1.8 – Provide a variety of housing types in Rancho Cordova to support a diverse economy, including workforce housing, move-up housing, and executive housing.	**Consistent.** See response to Policy UD.1.1 (above).
Policy ED.2.1 – Provide a mix of neighborhood retail, community retail, regional retail and specialty retail to serve Rancho Cordova and surrounding communities to achieve the recommendations outlined in the City's Retail Strategy.	**Consistent.** The proposed project includes 32,000 square feet of neighborhood-serving commercial/retail space for the planned community and nearby areas.
Policy ED.2.3 - Strategically locate regional retail properties to take advantage of the local and regional transportation corridors (e.g., Highway 50, State Route 16, light rail, etc.) and integrate local retail and services into neighborhoods.	**Consistent.** The proposed project proposes a retail center along Chrysanthy Boulevard and Rancho Cordova Parkway, that would be integrated into the community through pedestrian and bicycle connections as well as landscaping transitions.
HOUSING	
Policy H.1.1 – Improve the City's jobs-housing balance through ensuring that housing development in Rancho Cordova provides opportunities for all income levels in order to serve the full range of available and projected jobs in the City.	**Consistent.** The variety of residential densities (including low and medium densities) provided for in the proposed project would result in a range of housing types and opportunities for a range of income levels. See also, response to Policy UD.1.1 and Policy LU.1.3 (above).
Policy H.1.2: Maintain adequate sites that support a range of housing types appropriate for the City's housing needs, taking into account employment projections, household growth, and the City's share of regional housing needs.	**Consistent.** See response to Policy UD.1.1 (above), Policy LU.1.3 (above) and Policy H.1.1 (above).
Policy H.1.3 – Promote a broader range of housing options for executives.	**Consistent.** The project includes non-restricted and age-restricted single family residential uses, with a variety of lot sizes and significant community amenities (parks, off-street trail system, open space, age-restricted community center and garden), that may appeal to executives.
Policy H.1.4 – Ensure that an appropriate range of housing opportunities is available to accommodate both local and out-of-region executives.	**Consistent.** See response to Policy UD.1.1 and Policy H.1.3 (above).
Policy H.1.5 – Promote higher density housing in close proximity to transit, employment, and appropriate services, such as transit-oriented development.	**Consistent.** The proposed project includes high and medium density residential uses adjacent to the proposed Signature Bus Route facility along Rancho Cordova Parkway and the two commercial parcels at the intersection of Rancho Cordova Parkway and Chrysanthy Boulevard.
Policy H.4.1 – Ensure that neighborhoods are developed in a balanced, sustainable manner, avoiding over-concentration of affordable housing or over-sized rental complexes and providing a range of housing prices and rents.	**Consistent.** As identified in the Tentative Subdivision Map for the project, the high and medium densities of housing within the project are interspersed with lower density residential, avoiding over concentration. The various lot sizes and housing types would result in a range of housing prices and rents.
Policy H.4.5 – Ensure that adequate parking is available in multi-family rental properties, condominiums, townhomes, and senior facilities.	**Consistent.** The proposed project will be subject to Zoning Code Section 23.719, which regulates parking and loading standards.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy H.4.6 – Ensure that housing appropriate for empty-nesters and single persons, such as townhomes or small lot, single-family homes, rather than large single-family homes, is developed.	**Consistent.** See discussion under Policy H.1.1 above. Higher density residential development is included within the proposed project and is typically associated with townhomes and other multi-family homes as well as small lot detached homes.
Policy H.4.8 – The City will continue to promote equal housing opportunity for all persons regardless of race, religion, sex, marital status, ancestry, nation origin, color, disability, familial status, source of income, or sexual orientation.	**Consistent.** The proposed project encourages diversity and balance by encouraging housing, social and economic diversity through an appropriate mix of integrated land uses that result in a vibrant community with rich experiences and conveniences.
Policy H.4.9 – Promote improved aesthetics and amenities in residential construction.	**Consistent.** The project has prepared a SPA Handbook that addresses the design of the neighborhoods, including architectural styles and development standards for single-family, multifamily, and commercial uses, as well as a Parks + Open Space Design Program and Circulation Design Standards.
Policy H.6.1 – Require energy efficiency in the design and construction of housing developments through implementation of the State Energy Conservation Standards (Title 24). The long-term economic and environmental benefits of energy efficiency shall be weighed against any increased initial costs of energy saving measures. Encourage sustainable development by reducing energy use.	**Consistent.** All construction is required to conform to Title 24 as that regulation exists at the time of construction of commercial, office and residential uses. Additionally, details regarding project design measures that address energy efficiency as well as mitigation measures are presented in Section 3.2 (Air Quality) and Section 3.6 (Greenhouse Gases, Climate Change, and Energy) of The Ranch Draft EIR.
Policy H.6.2 – Encourage participation in SMUD's photovoltaic (solar), energy efficiency, peak reduction, and other comparable programs.	**Consistent.** The project would either provide on-site renewable energy systems for the residential lots, which would then connect to SMUD's system, or would partner with SMUD to provide a renewable energy commitment for the residential uses.
Policy H.7.4 – Require non-residential development to provide for the affordable housing needs generated or contributed to by their development.	**Consistent.** The project provides two multifamily parcels, including one parcel that could be used to provide affordable housing. See response to Policy UD.1.1 and Policy H.4.1 (above).
CIRCULATION	
Policy C.1.1 - Implement the Circulation Plan with the Roadway System and Sizing Diagram, shown as Figure C-1, as a modified grid network.	**Consistent.** The proposed project is consistent with the General Plan's Roadway System and Sizing Diagram.
Policy C.1.2 - Seek to maintain operations on all roadways and intersections at Level of Service D or better at all times, including peak travel times, unless maintaining this Level of Service would, in the City's judgment, be infeasible and/or conflict with the achievement of other goals. Congestion in excess of Level of Service D may be accepted in these cases, provided that provisions are made to improve traffic flow and/or promote non-vehicular transportation as part of a development project or a City-initiated project. Please see Policy C.1.3 for additional policy guidance related to this issue. Examples of system improvements which may be accepted when Level of Service D cannot be maintained include the following, where the improvement or funding is in excess of standard City requirements: Development of on- or off-street bicycle or pedestrian circulation (not including sidewalks that are constructed as part of roadway improvements);	**Consistent.** The analysis included in Section 3.13 of The Ranch Draft EIR utilized LOS D as the minimum acceptable level of service for City roadways analyzed in the section and identifies feasible mitigation measures to reduce the project's impact to City roadway facilities as well as identifies where maintaining LOS D is not feasible, and/or would conflict with other City goals. The project design provides for new roadway connections and additional trail, bike and transit facilities to promote non-vehicular transportation. The proposed project land use mix also provides for residential, retail, employment, and public (parks) uses within close proximity that would reduce length of vehicle miles traveled and internalize project traffic.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Providing or funding public transportation facilities or services; Other features as determined appropriate by the City.	
Policy C.1.4 - Discourage the creation of private roadways, except when the roadways are constructed to public roadway standards and private maintenance is assured, or are used in an affordable residential development.	**Consistent.** Some private roadways would be included in the proposed project. However, these would be maintained by private homeowner associations and would be constructed to the City's roadway standards.
Policy C.1.6 - Strongly discourage the use of cul-de-sacs on local roads, except where they are necessary due to site-specific concerns, such as habitat areas, that preclude construction of through routes. When cul-de-sacs are used, they should include bicycle and pedestrian connections to trail systems or adjacent major or connector streets.	**Consistent.** The proposed project includes some cul-de-sacs on local roads. However, when cul-de-sacs are used, they provide "pass-through" lots that offer bicycle and pedestrian connections to trail systems or adjacent major or connector streets and offer visibility into the cul-de-sacs from adjacent streets and uses.
Policy C.1.7 - Require the installation of traffic pre-emption devices for emergency vehicles (police and fire) at all newly constructed intersections and seek to retrofit all existing intersections to incorporate these features.	**Consistent.** The proposed project would install traffic pre-emption devices for emergency vehicles (police and fire) at signalized intersections.
Policy C.1.8 - Ensure that where traffic calming devices or techniques are employed, adequate access is provided for police and fire vehicles.	**Consistent.** See response to Policy C.1.7, above.
Policy C.1.9 – In an effort to reduce automobile traffic and congestion and increase use of other travel modes, support the use of trip reduction programs.	**Consistent.** As noted in Section 3.2, the project will implement a trip reduction program.
Policy C.1.10 – Encourage maximum block lengths that provide multiple vehicular paths and increase pedestrian circulation around the City at the neighborhood level. The City's preferred block length is less than 600 feet. Block lengths between 600 and 800 feet may be acceptable on a case-by- case basis, and block lengths greater than 800 feet are generally considered unacceptable.	**Consistent.** The proposed neighborhood streets have been developed to provide block lengths in the range of the City's preferred block lengths.
Policy C.2.1 - Create a system of on- and off- street trails and multi-use paths, as generally illustrated on Figure C-2, that are used for walking and bicycling and that are attractive, natural, and safe transportation corridors.	**Consistent.** The proposed project includes bike paths and trails that provide for an extensive trails network. Many of these trails are located in landscaped parkways, and along open space corridors within the proposed project. Additional circulation features for pedestrians and bicycles are also planned along major roads within the project.
Policy C.2.2 – Require bicycle and pedestrian connections to public transit systems at stops, stations, and terminals; carpool/vanpool park-and- ride lots; and activity centers (e.g., schools, community centers, medical facilities, senior residences, parks, employment centers, high- density residential areas, commercial centers).	**Consistent.** Transit (a Signature Bus Route) is planned for Rancho Cordova Parkway within the project area and the project would provide a transit stop for the planned route. The pedestrian and bicycle system, including a range of sidewalks, bike facilities, and an off-street trails, within the proposed project would allow for connections to planned transit as well as the proposed commercial, parks, and recreation uses.
Policy C.2.3 - In designing development projects, design for the pedestrian first.	**Consistent.** All subdivisions will be constructed with sidewalks which will connect to the trail system. Additionally, see response to Policy UD.3.2, above.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy C.2.4 - Provide sidewalks throughout the City. Meandering sidewalks are discouraged, except where necessary to accommodate site- specific features such as trees or habitat.	**Consistent.** Sidewalks are planned to run parallel with the curb on all public streets.
Policy C.2.5 - Provide safe and convenient bicycle access to all parts of the community.	**Consistent.** See discussion under Policy C.2.1 and Policy C.2.2 above.
Policy C.2.6 – Provide on-street bike lanes along all connector roadways and on local and major roadways when necessary to provide for interconnected routes. On-street bike routes may be provided on local, connector, and major roadways as deemed necessary by the City.	**Consistent.** See discussion under Policy C.2.1 and Policy C.2.2 above.
Policy C.2.8 - Promote bicycling and walking as a safe and attractive activity. Educate all road users to share the road and interact safely.	**Consistent.** The project has been designed to provide an extensive network of pedestrian and bicycle facilities, with marked features, including road crossings, bicycle lanes, etc., to encourage safe walking and bicycling. Additionally, see response to Policy UD.3.2, above.
Policy C.2.10 – Create safe and efficient at-grade crossings of roadways for pedestrian and bicyclists.	**Consistent.** See discussion under Policy C.2.1 and Policy C.2.2 above.
Policy C.3.1 - Advocate and develop transit services which meet the needs of residents and employees in Rancho Cordova.	**Consistent.** As previously described, the project will provide a transit facility to serve the Signature Bus Route planned for Rancho Cordova Parkway by the City's Transit Master Plan.
Policy C.3.3 - Promote the integration of transit facilities into new development.	**Consistent.** See response to Policy C.3.1 above.
Policy C.5.2 - Require proposed new development projects to analyze their contribution to increased traffic and to implement improvements necessary to address their impact on facilities not covered by a fee program.	**Consistent.** A traffic study has been prepared for the proposed project, and is included incorporated by reference. Results from the study, including requirements for the project to contribute to facilities that it has the potential to significantly impact, have been incorporated into the Section 3.13, Traffic and Transportation, of The Ranch Draft EIR.
Policy C.5.3 - Assess fees sufficient to cover the fair share portion of all new development impacts on the local and regional transportation system.	**Consistent.** The proposed project will be subject to improvement fees based on the necessary improvements identified in the traffic study prepared for this project.
OPEN SPACE, PARKS AND TRAILS	
Policy OSPT.1.1 - Review all proposals for new residential development to ensure each project complies with the City's minimum standards for parkland dedication, and is consistent with Cordova Recreation and Park District goals.	**Does Not Conflict.** The Rancho Cordova General Plan requires that new residential development dedicate parkland at a rate of five acres of land per 1,000 people. The proposed project is addressing the demand for parkland through a two-fold approach: the project would dedicate a 10.78-acre active park site, a 1.21-acre passive park site, and a 7.86-acre passive recreation open space site to the CRPD. The project would provide an additional trail along the nature preserve as well as private facilities, including a 5.40-acre recreation center, a 1.10-acre garden, and a 1.40-acre passive park, for the age-restricted component of the project. These facilities would total 27.75 acres, not including the off-street trail system adjacent the preserve.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy OSPT.1.2 - Coordinate with the Cordova Recreation and Park District to ensure that parks are provided, developed, and operated in a way that ensures that the City's parks goals are achieved throughout the community.	**Consistent.** See response to Policy OSPT.1.1, and Policy LU.3.5, above.
Policy OSPT.1.3 - Encourage park development adjacent to school sites and other compatible uses (public and private) for enhanced civic space and integration into the community.	**Consistent.** The proposed project does not include school sites. The proposed parks, trails, and public open space areas would be located within neighborhoods and adjacent to the preserve area.
Policy OSPT.1.4 – Ensure that adequate and reliable funding sources are established for the long term maintenance of parks and trails.	**Consistent.** The proposed project would dedicate the public parks and 7.86 acres of passive open space to CRPD. The timing for the delivery of parks, recreation facilities, and open space shall be determined before the approval of the first tentative subdivision map in the corresponding phase of the proposed project.
Policy OSPT.2.1 - Review all proposals for new residential development to ensure compliance with the City's minimum open space standards.	**Consistent.** See response to Policy OSPT.1.1, above.
Policy OSPT.2.3 - Maximize the potential benefits of natural resource mitigation lands within urban development.	**Consistent.** The preserve portion of the project area not only provides mitigation for impacts to biological resources but also a benefit to the visual quality of the site. The preserve provides further benefit through trails planned along the perimeter of the preserve (outside the actual preserve area) in order to increase opportunities for community enjoyment of the preserve.
Policy OSPT.3.1 - Develop a trails system that provides for maximum connectivity, so that all trails are linked for greater use as recreational and travel routes.	**Consistent.** The proposed project includes pedestrian, bicycle, and trail facilities that provide connectivity throughout the site as well as connections to existing and planned bike and pedestrian facilities in the area. The project also proposes enhanced street crossing locations for trails.
Policy OSPT.3.3 - Provide major off-street trails with grade-separated crossings or enhanced at- grade pedestrian crossings, especially across four- lane streets and collector roadways, to provide safe routes free from conflicts with vehicles.	**Consistent.** The proposed project includes enhanced at-grade pedestrian crossings along Chrysanthy Boulevard.
INFRASTRUCTURE, SERVICES AND FINANCE	
Policy ISF.2.1 – Ensure the development of public infrastructure that meets the long-term needs of residents and ensure infrastructure is available at the time such facilities are needed.	**Consistent.** See response to Policy LU.2.5, above.
Policy ISF.2.2 - Coordinate with independent public service providers, including schools, parks and recreation, utility, transit, and other service districts, in developing service and financial planning strategies.	**Consistent.** Preparation of the proposed project has involved coordination with public service providers, including The Sacramento Metro Fire Department, Rancho Cordova Police Department, Elk Grove Unified School District (EGUSD), the CRPD, utility providers, and other responsible public service providers.
Policy ISF.2.3 - Ensure that adequate funding is available for all infrastructure and public facilities, and make certain that the cost of improvements is equitably distributed.	**Consistent.** The phasing plan will assure equitable distribution of burden for facility costs within the proposed project as well as timely provision of needed infrastructure.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy ISF.2.4 - Ensure that water supply and delivery systems are available in time to meet the demand created by new development, or are guaranteed to be built by bonds or securities.	**Consistent.** A Water Supply Assessment was prepared in conjunction with this EIR. The project was anticipated in Sacramento County Water Agency's Urban Water Management Plan and the project would connect to existing water supply infrastructure.
Policy ISF.2.5 - Ensure that water flow and pressure are provided at sufficient levels to meet domestic, commercial, industrial, and firefighting needs.	**Consistent.** All subdivision improvements will meet City and Sacramento Metropolitan Fire District standards, including flow and pressure standards.
Policy ISF.2.6 - Ensure that sewage conveyance and treatment capacity are available in time to meet the demand created by new development, or are guaranteed to be built by bonds or other sureties.	**Consistent.** The requirement addresses mandatory findings of the State Map Act to be made at the time of approval of a final map for recordation. This language will be referenced in the project Development Agreement
Policy ISF.2.7 – Minimize visual impacts and physical impediments of utility sites, infrastructure, and equipment.	**Consistent.** The majority of utility infrastructure will be installed underground, eliminating visual impacts. Electrical supply infrastructure is commonly installed underground between power substations and individual customers. Telephone and cable television are installed underground as well. Water supply and wastewater infrastructure is to be installed under roadways. Existing transmission lines will be visible and have been incorporated into the proposed open space lots and preserve to reduce visual impacts.
Policy ISF.3.2 – Support enhanced library services for existing and future residents and employees that exceed regional and national standards.	**Does Not Conflict.** The proposed project does not include a library. As discussed in Section 3.12 (Public Services and Recreation), the proposed project does not trigger the need for new facilities or expansion of existing facilities associated with other public services and facilities, such as libraries and community buildings. The project would be subject to the City's impact fees for new development as well as property taxes, sales taxes, and other revenues generated by the proposed project, that may be used to fund library and other public services.
NATURAL RESOURCES	
Policy NR.1.1 - Protect rare, threatened, and endangered species and their habitats in accordance with State and federal law.	**Consistent.** The proposed project design provides protection of a majority of the higher quality wetland habitat on the site. In addition to the site design, the project site's biological resources have been evaluated under several technical studies. Multiple studies to address biological resources have been prepared for the project to identify potential impacts and, where necessary, mitigation measures have been identified to address impacts, as described in Section 3.3 (Biological Resources) of The Ranch Draft EIR to address impacts to rare, threatened and endangered species and habitats in accordance with State and federal law, as well as to the furthest extent feasible.
Policy NR.1.2 - Conserve Swainson's hawk habitat consistent with State policies and Department of Fish and Game guidelines.	**Consistent.** The Biological Resources section (Section 3.3) address impacts to Swainson's hawk and provides mitigation to reduce impacts to Swainson's hawks and other tree-nesting birds (see Section 3.3). This mitigation would reduce project impacts to these species to the furthest extent feasible and be consistent with the General Plan policy.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy NR.1.6 – Participate in the development of a habitat conservation plan to address the unique biological resources in Rancho Cordova.	**Consistent.** The City has been an active participant in development of the South Sacramento Habitat Conservation Plan (SSHCP) and the project anticipates participation in the SSHCP.
Policy NR.1.7 – Prior to project approval, the City shall require a biological resources evaluation for private and public development projects in areas identified to contain or possibly contain listed plant and/or wildlife species based upon the City's biological resource mapping provided in the General Plan EIR or other technical materials.	**Consistent.** See analysis associated with Policy NR1.1.
Policy NR.1.8 - The City shall encourage creation of habitat preserves that are immediately adjacent to each other in order to provide interconnected open space areas for animal movement.	**Consistent.** The project would preserve approximately 199.5 acres as a nature preserve that would be deeded to a third-party conservation entity. Preserves are physically connected either directly with one another or by way existing creek corridors and or drainages. The preserve has been designed as a continuous feature to that runs the extent of the project site, to allow connectivity to potential future preserve areas on adjoining lands to the east and southwest.
Policy NR.1.9 - The City shall require that impacts to riparian habitats be mitigated at a no net loss of existing function and value based on field survey and analysis of the riparian habitat to be impacted. No net loss may be accomplished by avoidance of the habitat, restoration of existing habitat, or creation of new habitat, or through some combination of the above.	**Consistent.** The Biological Resources section (Section 3.3) of The Ranch Draft EIR address impacts to riparian habitats. The project would not have substantial adverse effects on riparian habitat.; however, the project would result in impacts to sensitive natural community. Mitigation is provided (see Section 3.3) to reduce impacts to sensitive habitats to a less than significant level and be consistent with the General Plan policy.
Policy NR.1.11 - In such cases where habitat preserves are crossed by a roadway, or where two adjacent preserves are separated by a roadway, the roadway shall be designed or updated with wildlife passable fencing separating the roadway from the preserve and/or shall incorporate design features that allow for the movement of wildlife across or beneath the road without causing a hazard for vehicles and pedestrians on the roadway.	**Consistent.** See discussion under Policy NR.1.10 above.
Policy NR.2.1 – Require mitigation that provides for "no net loss" of wetlands consistent with current State and federal policies.	**Consistent.** See discussion under Policy NR.1.9 above. Mitigation measures included in Section 3.3 of The Ranch Draft EIR require that the project applicant ensure no net loss of wetlands.
Policy NR.2.2 - Ensure that direct and indirect effects to wetland habitats are minimized by environmentally sensitive project siting and design, to the maximum extent feasible.	**Consistent.** See discussion under Policy NR.1.10 above. Mitigation measures under Section 3.3 of the EIR address direct and indirect effects to wetland resources. Because of the general plan designation for the project area, which contemplates fairly dense urban development, the avoidance of all wetland habitat has proven to be infeasible. However, wetlands have been avoided or impacts have been minimized where feasible and the project has included a continuous preserve area to provide for the long-term protection and conservation of an extensive amount of wetland habitats.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy NR.2.5 - The City shall require that drainage improvements that discharge into areas of wetlands to be preserved are, to the maximum extent feasible, designed to mimic the undeveloped surface water flow conditions of the area in terms of seasonality, volume, and flow velocity.	**Consistent.** The proposed project proposes to discharge directly to basins which will have multiple functions and which will mimic natural discharge sequences.
Policy NR.3.2 - In general, the City will encourage the preservation of existing location, topography, and meandering alignment of creeks. Where necessary, and if consistent with other City policies, the creation and realignment of creek corridors shall be constructed to recreate the character of the natural creek corridor. Channelization and the use of concrete within creek corridors shall not be supported.	**Consistent.** See discussion under Policy NR.1.1 above. An extensive amount of on-site wetlands and aquatic areas would be retained through the project area within the proposed preserve area.
Policy NR.3.4 – Encourage projects that contain wetland preserves or creeks, or are located adjacent to wetland preserves or creeks, to be designed for visibility and, as appropriate, access.	**Consistent.** The proposed project includes significant opportunity for access and direct view of the onsite wetlands and preserve areas.
Policy NR.4.1 - Conserve native oak and landmark tree resources for their historic, economic, aesthetic, and environmental value.	**Consistent.** There are no trees located on the project site. Therefore, the project would not conflict with the City's Preservation and Protection of Private Trees Ordinance.
Policy NR.4.2 - Improve overall landscaping quality and sustainability in all areas visible to the public.	**Consistent.** See response to Policy UD.2.4, above.
Policy NR.4.4 - Prior to the approval of any public or private development project in areas identified or assumed to contain trees, the City shall require that a determinate survey of trees species and size be performed. If any native oaks or other native trees six inches or more in diameter at breast height (dbh), multi-trunk native oaks or native trees of 10 inches or greater dbh, or non-native trees of 18 inches or greater dbh that have been determined by a certified arborist to be in good health are found to occur, such trees shall be avoided if feasible. If such trees cannot be avoided, the project applicant shall do one of the following: All such trees shall be replaced at an inch- for-inch ratio. A replacement tree planting plan shall be prepared by a certified arborist or licensed landscape architect and shall be submitted to the City of Rancho Cordova for approval prior to removal of trees; or, The project applicant shall submit a mitigation plan that provides for complete mitigation of the removal of such trees in coordination with the City of Rancho Cordova. The mitigation plan shall be subject to the approval of the City. If the City of Rancho Cordova adopts a tree preservation ordinance at any time in the future, any future development activities shall be subject to that ordinance instead.	**Consistent.** See analysis under Policy NR4.1.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
Policy NR.5.1 - Promote water conservation within existing and future urban uses.	**Consistent.** As required by Mitigation Measure 3.2-1 of The Ranch Draft EIR, the project would use water-efficient irrigation systems and would use low-flow appliances for all residential uses.
Policy NR.5.2 - Encourage the use of treated wastewater to irrigate parks, golf courses, and landscaping.	**Does not Conflict.** The project does not include the use of treated wastewater.
Policy NR.5.3 - Protect surface and ground water from major sources of pollution, including hazardous materials contamination and urban runoff.	**Consistent.** Mitigation measures included in Section 3.8 of The Ranch Draft EIR as well as compliance with the required SWPPP and City's existing NPDES permit (CAS082597) would ensure that the proposed project is consistent with this policy.
Policy NR.5.4 - Prevent contamination of the groundwater table and surface water, and remedy existing contamination to the extent practicable.	**Consistent.** This issue is addressed in Section 3.8 (Hydrology and Water Quality) of The Ranch Draft EIR.
Policy NR.5.5 – Minimize erosion to stream channels resulting from new development in urban areas consistent with State law.	**Consistent.** The drainage plan submitted with the proposed project applies a project wide system of water quality/flow duration control/stormwater detention basins to accomplish this policy.
Policy NR.5.6 - Incorporate Storm Water, Urban Runoff, and Wetland Mosquito Management Guidelines and Best Management Practices into the design of water retention structures, drainage ditches, swales, and the construction of mitigated wetlands in order to reduce the potential for mosquito-borne disease transmission.	**Consistent.** Basins and swales will be constructed and operated in conformance with applicable City requirements, as well as health and safety best management practices.
Policy NR.5.7 - Continue to cooperate and participate with the County, other cities, and the Regional Water Quality Control Board regarding compliance with the joint National Pollutant Discharge Elimination System Permit (NPDES No. CAS082597) or any subsequent permit and support water quality improvement projects in order to maintain compliance with regional, state and federal water quality requirements.	**Consistent.** A drainage plan is included as part of the proposed project. The Drainage Plan will be consistent with the joint National Pollutant Discharge Elimination System Permit (NPDES No. CAS082597).
Policy NR.7.1 - Increase energy conservation Citywide.	**Consistent.** See response to Policy H.6.1, Policy H.6.2, and Policy LU.2.7, above.
Policy NR.7.2 - Promote the development and use of advanced energy technology and building materials in Rancho Cordova.	**Consistent.** See response to Policy H.6.1, Policy H.6.2, and Policy LU.2.7, above.
Policy NR.7.3 – Encourage the development of energy efficient buildings and subdivisions.	**Consistent.** See response to Policy H.6.1, Policy H.6.2, and Policy LU.2.7, above.
CULTURAL AND HISTORIC RESOURCES	
Policy CHR.1.3 - Establish review procedures for development projects that recognize the history of the area in conjunction with State and federal laws. (Further implemented through Actions CHR.1.3.1 and CHR.1.3.2)	**Consistent.** A cultural resource study was completed for the project. Outreach to Native American tribes was performed as required by State law. Mitigation measures have been identified in Section 3.4 (Cultural and Tribal Resources) of The Ranch Draft EIR.
SAFETY	
Policy S.1.1 - Maintain acceptable levels of risk of injury, death, and property damage resulting from reasonably foreseeable safety hazards in Rancho Cordova.	**Consistent.** Section 3.7 (Hazards and Hazardous Materials) of The Ranch Draft EIR analyzes potential hazards associated with the project. As discussed, the project applicant would be required to submit a Construction Site Management Plan for review and approval by the City. Additionally, the applicant would be required to submit a HMBP to the Sacramento County Environmental Management Department (CUPA) for review and approval. Compliance with these programs is intended to reduce

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
	the risks of injury, death, and property damage to levels deemed acceptable under federal and state law.
Policy S.1.5 - The City shall require written confirmation from applicable local, regional, state, and federal agencies that known contaminated sites have been deemed remediated to a level appropriate for land uses proposed prior to the City approving site development or provide an approved remediation plan that demonstrates how contamination will be remediated prior to site occupancy. This documentation will specify the extent of development allowed on the remediated site as well as any special conditions and/or restrictions on future land uses.	**Consistent.** See discussion under Policy S.1.1 above.
Policy S.2.2 - Manage the risk of flooding by discouraging new development located in an area that is likely to flood.	**Consistent.** The project site is not located in the 100-year floodplain.
Policy S.2.3 – Discourage the creation of new parcels when the presence of easements, floodplain, marsh, or riparian habitat, and/or other features would leave insufficient land to build and operate structures. This policy shall not apply to open space lots specifically created for dedication to the City or another appropriate party for habitat protection, flood control, drainage, or wetland maintenance.	**Consistent.** The project is designed with a mixture of residential, commercial, and natural spaces to maximize the developed area while preserving aquatic resources.
Policy S.2.4 – Ensure that adequate drainage exists for both existing and new development.	**Consistent.** Development will provide adequate drainage and will not increase flows from the project site.
Policy S.3.2 - Ensure that new structures are protected from damage caused by geologic and/or soil conditions to the greatest extent feasible.	**Consistent.** The project site is located in an area of low seismic activity, site soils are not subject to liquefaction, and structures at the site would be designed in accordance with State building standards.
Policy S.5.2 Consider the potential impact of hazardous facilities on the public and/or adjacent or nearby properties posed by reasonably foreseeable events. The City considers an event to be "reasonably foreseeable" when the probability of the event occurring is greater than one in one million per year.	**Consistent.** The proposed project does not include development of hazardous facilities. Impacts associated with hazardous materials are considered and addressed in Section 3.7, Hazards and Hazardous Materials, of The Ranch Draft EIR.
Policy S.5.3 - Regulate the storage of hazardous materials and waste consistent with State and Federal law.	**Consistent.** Commercial uses would likely store varying amounts of hazardous materials. These uses will be required to adhere to all federal, state, and local laws relating to the storage of hazardous materials.
Policy S.5.5 - Separate hazardous or toxic materials from the public.	**Consistent.** Commercial uses to be constructed as part of the proposed project are the most likely location for the use or storage of hazardous or toxic materials. These uses will be required to adhere to all federal, state, and local laws relating to the use, storage, or transport of hazardous materials.
Policy S.7.1 - Use Crime Prevention Through Environmental Design (CPTED) principles in the design of projects and buildings.	**Consistent.** The proposed project has undergone review by City departments, including the Police Department. Police Department recommendations have been considered in development of the project, including use of various CPTED principles.
AIR QUALITY	
Policy AQ.1.2 – Evaluate projects for compliance with State and federal ambient air quality standards and the Sacramento Metropolitan Air Quality Management	**Consistent.** Compliance with these standards and thresholds are addressed in Sections 3.2 (Air Quality) and 3.6 (Greenhouse Gases, Climate Change, and Energy) of The Ranch Draft EIR.

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
District's (SMAQMD) thresholds of significance. (Refer to Table AQ-3 in this Element for ambient air quality standards.)	
Policy AQ.1.5 - Require odor impact analyses be conducted for evaluating new development requests that either could generate objectionable odors that may violate SMAQMD Rule 402 or any subsequent rules and regulations regarding objectionable odors near sensitive receptors or locate new sensitive receptors near existing sources of objectionable odors. Should objectionable odor impacts be identified, odor mitigation shall be required in the form of setbacks, facility improvements or other appropriate measures.	**Consistent.** The proposed project does not include land uses that would generate significant odors. Odor impacts on proposed residential uses are discussed in Section 3.2 (Air Quality) of The Ranch Draft EIR.
Policy AQ.2.1 - Promote strategic land use patterns for businesses that reduce the number and length of motor vehicle trips and that encourage multiple forms of transportation for employees and patrons.	**Consistent.** See response to Policy LU 1.3, above.
Policy AQ.2.2 - Encourage mixed-use developments that put residences in close proximity to services, employment, transit, schools, and civic facilities/services.	**Consistent.** See response to Policy LU1.3, above.
Policy AQ.2.5 - Utilize the guidelines in the California Air Resources Control Board *Air Quality and Land Use Handbook: A Community Health Perspective* when evaluating new development requests that either would generate toxic air contaminant emissions near sensitive receptors or locate new sensitive receptors near existing sources of air toxic emissions or order to minimize health hazards, and implement all feasible best available control technology, as required by SMAQMD.	**Consistent.** The Ranch Draft EIR (see Section 3.2) evaluated potential impacts associated with the guidelines in the California Air Resources Control Board Air Quality and Land Use Handbook: A Community Health Perspective.
Policy AQ.3.1 - Promote walking and bicycling as viable forms of transportation to services, shopping, and employment.	**Consistent.** See response to UD.3.2, above.
Policy AQ.4.1 - Promote improved air quality benefits through energy conservation measures for new and existing development.	**Consistent.** See response to Policy LU.2.7, above.
Policy AQ.5.2 - Support programs that encourage children to safely walk or bike to school.	**Consistent.** Existing and future planned schools are located in nearby developments located in the southern portion of the City. The s project will include sidewalks, standard pedestrian crossing warning signs, signs to identify pedestrian and bicycle paths, and pedestrian signal heads to provide safe pedestrian and bicycle facilities and will provide for connectivity to adjacent bicycle and pedestrian facilities. Sidewalks will be constructed as part of the frontage improvements along all new roadway construction for Jaeger Road/Rancho Cordova Parkway and Chrysanthy Boulevard.
NOISE	
Policy N.1.2 - Ensure that the indoor and outdoor areas of new projects will be located, constructed, and/or shielded from noise sources in compliance with the City's noise standards to the maximum extent feasible.	**Consistent.** Proposed project noise impacts are discussed in Section 3.10 of The Ranch Draft EIR. Mitigation measures are presented to reduce noise impacts to indoor and outdoor areas of new projects to the furthest extent feasible.
Policy N.1.3 - Ensure that proposed non-residential land uses likely to exceed the City's standards do not	**Consistent.** Non-residential uses are sited within specific areas of the project area and are located immediately adjacent to other

GENERAL PLAN POLICY	*PROJECT CONSISTENCY*
create noise disturbances in existing noise-sensitive areas.	noise generating uses in order to minimize the area impacted by these noise sources. Additionally, mitigation measures included in Section 3.10 of The Ranch Draft EIR would ensure that impacts to existing noise sensitive areas are consistent with City standards.
Policy N.1.4 - Mitigate noise created by proposed non-transportation noise sources to comply with the City's noise standards to the maximum extent feasible.	**Consistent.** See discussion under Policy N.1.2 above.
Policy N.1.5 - Mitigate noise created by the construction of new transportation noise sources (such as new roadways or new light rail service) to the maximum extent feasible to comply with the City's standards.	**Consistent.** See discussion under Policy N.1.2 above. At present, the City has no plan to extend light rail service through the project area.
Policy N.1.6 – Ensure that comfortable noise levels and adequate privacy are maintained in higher density development.	**Consistent.** See discussion under Policy N.1.2 above.
Policy N.1.7 - To the extent feasible and appropriate, the City shall require the use of temporary construction noise control measures for public and private project that may include the use of temporary noise barriers, temporary relocation of noise-sensitive land uses or other appropriate measures.	**Consistent.** Construction noise impacts are reduced by mitigation measures included in Section 3.10 of The Ranch Draft EIR. Mitigation includes methods described in this policy.
Policy N.1.8 - New residential development shall only be allowed inside of the 60 CNEL Mather Airport Policy Area if the following conditions are met: Noise insulation is provided in all new residential dwelling units that reduces interior noise levels to 45 dB with windows closed in any habitable room. Prospective buyers are notified through the Public Report prepared by the California Department of Real Estate disclosing the fact that the parcel is located within the Mather Airport Policy Area. An Aviation Easement is recorded on the property acknowledging that the property is located within the Mather Airport Policy Area. The easement shall grant the right of flight and unobstructed passage of all aircraft into and out of Mather Airport. The Avigation Easement shall be granted to the County of Sacramento, recorded with the Sacramento County Recorder and filed with the County Department of Airports.	**Consistent.** The proposed project is not located within the 60 CNEL Mather Airport Policy Area.
Policy N.2.2 - Ensure that operational noise levels of new roadway projects will not result in significant noise impacts.	**Consistent.** Section 3.10 of The Ranch Draft EIR evaluates noise exposure associated with new roadway facilities. As discussed in Section 3.10, the project is not anticipated to result in significant noise impacts to existing receptors and mitigation is provided to ensure that sensitive receptors associated with the proposed project are not subjected to significant noise levels.

Roseville, CA 95678

This section provides a general description of the existing noise sources in the Project vicinity, a discussion of the regulatory setting, and identifies potential noise impacts associated with the proposed Project. Project impacts are evaluated relative to applicable noise level criteria and to the existing ambient noise environment. Mitigation measures have been identified for significant noise-related impacts.

3.7.1 ENVIRONMENTAL SETTING

KEY TERMS

Acoustics	The science of sound.
Ambient Noise	The distinctive acoustical characteristics of a given area consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.
Attenuation	The reduction of noise.
A-Weighting	A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.
Decibel or dB	Fundamental unit of sound, defined as ten times the logarithm of the ratio of the sound pressure squared over the reference pressure squared.
CNEL	Community noise equivalent level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by a factor of three and nighttime hours weighted by a factor of 10 prior to averaging.
Frequency	The measure of the rapidity of alterations of a periodic acoustic signal, expressed in cycles per second or Hertz.
Impulsive	Sound of short duration, usually less than one second, with an abrupt onset and rapid decay.
L_{dn}	Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.
L_{eq}	Equivalent or energy-averaged sound level.
L_{max}	The highest root-mean-square (RMS) sound level measured over a given period of time.
$L_{(n)}$	The sound level exceeded a described percentile over a measurement period. For instance, an hourly L_{50} is the sound level exceeded 50 percent of the time during the one hour period.
Loudness	A subjective term for the sensation of the magnitude of sound.
Noise	Unwanted sound.
SEL	Sound exposure levels. A rating, in decibels, of a discrete event, such as an aircraft flyover or train passby, that compresses the total sound energy into a one-second event.

3.7 NOISE

FUNDAMENTALS OF ACOUSTICS

Acoustics is the science of sound. Sound may be thought of as mechanical energy of a vibrating object transmitted by pressure waves through a medium to human (or animal) ears. If the pressure variations occur frequently enough (at least 20 times per second), then they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second or Hertz (Hz).

Noise is a subjective reaction to different types of sounds. Noise is typically defined as (airborne) sound that is loud, unpleasant, unexpected or undesired, and may therefore be classified as a more specific group of sounds. Perceptions of sound and noise are highly subjective from person to person.

Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals), as a point of reference, defined as 0 dB. Other sound pressures are then compared to this reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB, and changes in levels (dB) correspond closely to human perception of relative loudness.

The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by A-weighted sound levels. There is a strong correlation between A-weighted sound levels (expressed as dBA) and the way the human ear perceives sound. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment. All noise levels reported in this section are in terms of A-weighted levels, but are expressed as dB, unless otherwise noted.

The decibel scale is logarithmic, not linear. In other words, two sound levels 10 dB apart differ in acoustic energy by a factor of 10. When the standard logarithmic decibel is A-weighted, an increase of 10 dBA is generally perceived as a doubling in loudness. For example, a 70-dBA sound is half as loud as an 80-dBA sound, and twice as loud as a 60-dBA sound.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given environment. A common statistical tool to measure the ambient noise level is the average, or equivalent, sound level (L_{eq}), which corresponds to a steady-state A weighted sound level containing the same total energy as a time varying signal over a given time period (usually one hour). The L_{eq} is the foundation of the composite noise descriptor, L_{dn}, and shows very good correlation with community response to noise.

The day/night average level (L_{dn}) is based upon the average noise level over a 24-hour day, with a +10 decibel weighing applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average,

it tends to disguise short-term variations in the noise environment. CNEL is similar to L_{dn}, but includes a +5-dB penalty for evening noise. Table 3.7-1 lists several examples of the noise levels associated with common situations.

TABLE 3.7-1: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	*NOISE LEVEL (DBA)*	*COMMON INDOOR ACTIVITIES*
	--110--	Rock Band
Jet Fly-over at 300 m (1,000 ft)	--100--	
Gas Lawn Mower at 1 m (3 ft)	--90--	
Diesel Truck at 15 m (50 ft), at 80 km/hr (50 mph)	--80--	Food Blender at 1 m (3 ft) Garbage Disposal at 1 m (3 ft)
Noisy Urban Area, Daytime Gas Lawn Mower, 30 m (100 ft)	--70--	Vacuum Cleaner at 3 m (10 ft)
Commercial Area Heavy Traffic at 90 m (300 ft)	--60--	Normal Speech at 1 m (3 ft)
Quiet Urban Daytime	--50--	Large Business Office Dishwasher in Next Room
Quiet Urban Nighttime	--40--	Theater, Large Conference Room (Background)
Quiet Suburban Nighttime	--30--	Library
Quiet Rural Nighttime	--20--	Bedroom at Night, Concert Hall (Background)
	--10--	Broadcast/Recording Studio
Lowest Threshold of Human Hearing	--0--	Lowest Threshold of Human Hearing

EFFECTS OF NOISE ON PEOPLE

The effects of noise on people can be placed in three categories:

- Subjective effects of annoyance, nuisance, and dissatisfaction;
- Interference with activities such as speech, sleep, and learning; and
- Physiological effects such as hearing loss or sudden startling.

Environmental noise typically produces effects in the first two categories. Workers in industrial plants can experience noise in the last category. There is no completely satisfactory way to measure the subjective effects of noise or the corresponding reactions of annoyance and dissatisfaction. A wide variation in individual thresholds of annoyance exists and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted: the so-called ambient noise level. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships occur:

- Except in carefully controlled laboratory experiments, a 1 dBA change cannot be perceived;
- Outside of the laboratory, a 3-dBA change is considered a just-perceivable difference;

- A change in level of at least 5-dBA is required before any noticeable change in human response would be expected; and
- A 10-dBA change is subjectively heard as approximately a doubling in loudness, and can cause an adverse response.

Stationary point sources of noise – including stationary mobile sources such as idling vehicles – attenuate (lessen) at a rate of approximately 6 dB per doubling of distance from the source, depending on environmental conditions (i.e. atmospheric conditions and either vegetative or manufactured noise barriers, etc.). Widely distributed noises, such as a large industrial facility spread over many acres, or a street with moving vehicles, would typically attenuate at a lower rate.

EXISTING NOISE LEVELS

Existing and Surrounding Land Uses

North: The Sunridge Park Village residential area is located directly north of the project site, south of Douglas Road and east of Sunrise Boulevard. A mix of industrial uses and additional residential communities are located north of Douglas Road.

East: The land directly to the east of the project site is vacant.

South: The land directly to the south of the project site is vacant.

West: Anatolia and Anatolia Village residential areas are located directly to the west of the project site. Another residential community is also under construction along with Rancho Cordova Parkway, which is being extended from Douglas Road to Chrysanthy Boulevard.

Existing Ambient Noise Levels

To quantify the existing ambient noise environment in the Project vicinity, short-term and continuous (24-hour) noise level measurements were conducted on the Project site on August 28th and 29th, 2018. The noise measurement locations are shown on Figure 3.7-4. The noise level measurement survey results are provided in Table 3.7-2. Appendix A of Appendix F shows the complete results of the noise monitoring survey.

The sound level meters were programmed to collect hourly noise level intervals at each site during the survey. The maximum value (L_{max}) represents the highest noise level measured during an interval. The average value (L_{eq}) represents the energy average of all of the noise measured during an interval. The median value (L_{50}) represents the sound level exceeded 50 percent of the time during an interval.

TABLE 3.7-2: SUMMARY OF EXISTING BACKGROUND NOISE MEASUREMENT DATA

SITE	LOCATION	DATE/TIME	L_{DN}	AVERAGE MEASURED HOURLY NOISE LEVELS, dB					
				DAYTIME (7AM-10PM)			NIGHTTIME (10PM-7AM)		
				L_{EQ}	L_{50}	L_{MAX}	L_{EQ}	L_{50}	L_{MAX}
Continuous (24-hour) Noise Level Measurements									
1	31 ft. from centerline of Rancho Cordova Parkway	08/28/18 - 08/29/18	52	51	40	72	44	34	63
2	North boundary of project site, behind 12368 Pawcatuk Way.	08/28/18 – 08/29/18	45	44	37	61	38	35	50
Short-Term Noise Level Measurements									
1	140 ft. from centerline of Rancho Cordova Parkway.	08/28/18 10:58 AM	NA	53	49	64	Construction at housing development to the west is the primary noise source.		

NOTE: SOURCE: SAXELBY ACOUSTICS, 2019.

Larson Davis Laboratories (LDL) Model 820, Model 812, and Model 831 precision integrating sound level meters were used for the ambient noise level measurement survey. The meters were calibrated before and after use with an LDL Model CAL200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute for Type 1 sound level meters (ANSI S1.4).

EXISTING ROADWAY NOISE LEVELS

To predict existing noise levels due to traffic, the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The model is based upon the Calveno reference noise emission factors for automobiles, medium trucks, and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site. The FHWA model was developed to predict hourly L_{eq} values for free-flowing traffic conditions.

Traffic volumes for existing conditions were obtained from the Traffic Data prepared for the Project (Kimley Horn). Truck percentages and vehicle speeds on the local area roadways were estimated from field observations.

Traffic noise levels are predicted at the sensitive receptors located at the closest typical setback distance along each Project-area roadway segment. Where traffic noise barriers are predominately along a roadway segment, a -5 offset was added to the noise prediction model to account for various noise barrier heights. A -5 to dB offset was also applied where outdoor activity areas are shielded by intervening buildings. In some locations, sensitive receptors may be located at distances which vary from the assumed calculation distance and may experience shielding from intervening barriers

or sound walls. However, the traffic noise analysis is believed to be representative of the majority of sensitive receptors located closest to the Project-area roadway segments analyzed in this report.

Table 3.7-3 shows the existing traffic noise levels in terms of L_{dn} at closest sensitive receptors along each roadway segment. A complete listing of the FHWA Model input data is contained in Appendix B of Appendix F.

3.7.2 REGULATORY SETTING

FEDERAL

There are no federal regulations related to noise that apply to the proposed Project.

STATE

California Environmental Quality Act

The California Environmental Quality Act (CEQA) Guidelines, Appendix G, indicate that a significant noise impact may occur if a project exposes persons to noise or vibration levels in excess of local general plans or noise ordinance standards, or cause a substantial permanent or temporary increase in ambient noise levels. CEQA standards are discussed more below under the Thresholds of Significance section.

California State Building Codes

The State Building Code, Title 24, Part 2 of the State of California Code of Regulations establishes uniform minimum noise insulation performance standards to protect persons within new buildings which house people, including hotels, motels, dormitories, apartment houses and dwellings other than single-family dwellings. Title 24 mandates that interior noise levels attributable to exterior sources shall not exceed 45 dB L_{dn} or CNEL in any habitable room.

Title 24 also mandates that for structures containing noise-sensitive uses to be located where the L_{dn} or CNEL exceeds 60 dB, an acoustical analysis must be prepared to identify mechanisms for limiting exterior noise to the prescribed allowable interior levels. If the interior allowable noise levels are met by requiring that windows be kept closed, the design for the structure must also specify a ventilation or air conditioning system to provide a habitable interior environment

City of Rancho Cordova General Plan

The City of Rancho Cordova General Plan Noise Element includes the following goals, policies, and actions regarding noise that are applicable to the proposed Project:

Goal N-1	Ensure that all new development will be free of noise disturbances.
Policy N-1.1	Establish standards and policies consistent with those in Tables N-1 and N-2 to govern maximum sound levels in new development.
Policy N-1.2	Ensure that the indoor and outdoor areas of new projects will be located, constructed, and/or shielded from noise sources in compliance with the City's noise standards to the maximum extent feasible.
Policy N-1.7	To the extent feasible and appropriate, the City shall require the use of temporary construction noise control measures for public and

private projects that may include the use of temporary noise barriers, temporary relocation of noise-sensitive land uses or other appropriate measures.

Noise Compatibility Standards

Table N-1 (Figure 3.7-1) of the General Plan shows the maximum allowable daytime and nighttime noise levels from non-transportation sources. Table N-2 (Figure 3.7-2) gives an overview of maximum interior and exterior traffic noise exposure for land use categories that are applied throughout the City.

TABLE N-1
CITY NOISE STANDARDS
NOISE LEVEL PERFORMANCE STANDARDS FOR NEW PROJECTS AFFECTED BY OR INCLUDING NON-TRANSPORTATION NOISE SOURCES

Stationary Noise Source	Noise Level Descriptor	Daytime Maximum (7 a.m. to 10 p.m.)	Nighttime Maximum (10 p.m. to 7 a.m.)
Typical	Hourly L_{eq}, dB	55	45
Tonal, impulsive, repetitive, or consist primarily of speech or music	Hourly Leq, dB	50	40

The City may impose noise level standards which are more or less restrictive than those specified above based upon determination of existing low or high ambient noise levels.

Figure 3.7-1: Table N-1 of the City of Rancho Cordova General Plan Noise Element

TABLE N-2
MAXIMUM TRANSPORTATION NOISE EXPOSURE

Land Use	Outdoor Activity Areas[1] Ldn/CNEL, dB	Interior Spaces	
		Ldn/CNEL, dB	Leq, dB[2]
Residential	60[3]	45	--
Residential subject to noise from railroad tracks, aircraft overflights, or similar noise sources which produce clearly identifiable, discrete noise events (e.g., the passing of a single train)	60[3]	40[5]	--
Transient lodging	60[4]	45	--
Hospitals, nursing homes	60[3]	45	--
Theaters, auditoriums, music halls	--	--	35
Churches, meeting halls	60[3]	--	40
Office buildings	--	--	45
Schools, libraries, museums	--	--	45
Playgrounds, neighborhood parks	70	--	--

1 Where the location of outdoor activity areas is unknown, the exterior noise level standard shall be applied to the property line of the receiving land use. Where it is not practical to mitigate exterior noise levels at patio or balconies of apartment complexes, a common area such as a pool or recreation area may be designated as the outdoor activity area.

2 As determined for a typical worst-case hour during periods of use.

3 Where it is not possible to reduce noise in outdoor activity areas to 60 dB Ldn/CNEL or less using a practical application of the best-available noise reduction measures, an exterior noise level of up to 65 dB Ldn/CNEL may be allowed provided that available exterior noise level reduction measures have been implemented and interior noise levels are in compliance with this table.

4 In the case of hotel/motel facilities or other transient lodging, outdoor activity areas such as pool areas may not be included in the project design. In these cases, only the interior noise level criterion will apply.

5 The intent of this noise standard is to provide increased protection against sleep disturbance for residences located near railroad tracks.

Figure 3.7-2: Table N-2 of the City of Rancho Cordova General Plan Noise Element

City of Rancho Cordova Municipal Code and Noise Ordinance

Chapter 6.68 of the Municipal Code identifies performance standards for noise. The maximum exterior noise level for Residential Districts is set at 55 dBA. This standard is 5.0 dBA lower between 10:00 P.M and 7:00 A.M. The following table from Section 6.68.070, subsection B (Figure 3.7-3) outlines allowable exterior noise standard exceedances in any one hour. The limits specified in subsection B are reduced by five dBA for noises which are impulsive or consist of speech or music. If the existing ambient noise level exceeds the first four categories in subsection B, then the allowable noise exterior limit shall be increased by five-dBA increments to encompass the ambient noise level.

Cumulative Duration of the Intrusive Sound	Allowance Decibels
1. Cumulative period of 30 minutes per hour	0
2. Cumulative period of 15 minutes per hour	+ 5
3. Cumulative period of 5 minutes per hour	+10
4. Cumulative period of 1 minute per hour	+15
5. Level not to be exceeded for any time per hour	+20

Figure 3.7-3: City of Rancho Cordova Municipal Code. Section 6.68.070, Subsection B

Furthermore, the interior noise level in any residential dwelling unit located in a mixed-use building or development shall not exceed forty-five dBA for a cumulative period of more than five minutes in any hour, fifty dBA for a cumulative period of more than one minute in any hour, or fifty-five dBA for any period of time. There is a slight reprieve in that the allowable noise limit shall be increased by five-dBA increments to encompass the ambient noise level if the existing ambient noise level exceeds the standard.

Exemptions to the interior and exterior noise standards are outlined in Section 6.68.090 of the City's Municipal Code. A list of the exemptions is provided here:

A. School bands, school athletic and school entertainment events;
B. Outdoor gatherings, public dances, shows and sporting and entertainment events, provided said events are conducted pursuant to a license or permit by the city;
C. Activities conducted on parks, public playgrounds and school grounds, provided such parks, playgrounds and school grounds are owned and operated by a public entity or private school;
D. Any mechanical device, apparatus or equipment related to or connected with emergency activities or emergency work;

E. Noise sources associated with construction, repair, remodeling, demolition, paving or grading of any real property, provided said activities do not take place between the hours of 8:00 p.m. and 6:00 a.m. on weekdays and Friday commencing at 8:00 p.m. through and including 7:00 a.m. on Saturday; Saturdays commencing at 8:00 p.m. through and including 7:00 a.m. on the next following Sunday and on each Sunday after the hour of 8:00 p.m.; provided, however, when an unforeseen or unavoidable condition occurs during a construction project and the nature of the project necessitates that work in process be continued until a specific phase is completed, the contractor or owner shall be allowed to continue work after 8:00 p.m. and to operate machinery and equipment necessary until completion of the specific work in progress can be brought to conclusion under conditions which will not jeopardize inspection acceptance or create undue financial hardships for the contractor or owner;

F. Noise sources associated with agricultural operations, provided such operations do not take place between the hours of 8:00 p.m. and 6:00 a.m.;

G. All mechanical devices, apparatus or equipment which are utilized for the protection or salvage of agricultural crops during periods of adverse weather conditions or when the use of mobile noise sources is necessary for pest control;

H. Noise sources associated with maintenance of residential area property, provided said activities take place between the hours of 6:00 a.m. and 8:00 p.m. on any day except Saturday or Sunday, or between the hours of 7:00 a.m. and 8:00 p.m. on Saturday or Sunday;

I. Any activity, to the extent provisions of Chapter 65 of Title 42 of the United States Code and Articles 3 and 3.5 of Chapter 4 of Part 1 of Division 9 of the Public Utilities Code of the state of California preempt local control of noise regulations and land use regulations related to noise control of airports and their surrounding geographical areas, any noise source associated with the construction, development, manufacture, maintenance, testing or operation of any aircraft engine, or of any weapons system or subsystems which are owned, operated or under the jurisdiction of the United States, or any other activity to the extent regulation thereof has been preempted by state or federal law or regulation;

J. Any noise sources associated with the maintenance and operation of aircraft or airports which are owned or operated by the United States. [Ord. 38-2007 § 1 (Exh. 1(E)); Ord. 21-2003 §§ 2, 4; Ord. 20-2003 §§ 2, 4; SCC 254 § 1 (part), 1976].

VIBRATION STANDARDS

Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that in that noise is generally considered to be pressure waves transmitted through air, whereas vibration usually consists of the excitation of a structure or surface. As with noise, vibration consists of an amplitude and frequency. A person's perception to the vibration will depend on their individual sensitivity to vibration, as well as the amplitude and frequency of the source and the response of the system which is vibrating.

Vibration can be measured in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration measures in terms of peak particle velocities in inches per second. Standards pertaining to perception as well as damage to structures have been developed for vibration levels defined in terms of peak particle velocities.

The City of Rancho Cordova not have specific policies pertaining to vibration levels. However, vibration levels associated with construction activities and railroad operations are addressed as potential noise impacts associated with Project implementation.

Human and structural response to different vibration levels is influenced by several factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. Table 3.7-4 indicates that the threshold for damage to structures ranges from 0.2 to 0.6 peak particle velocity in inches per second (in/sec p.p.v). One-half this minimum threshold or 0.1 in/sec p.p.v. is considered a safe criterion that would protect against architectural or structural damage. The general threshold at which human annoyance could occur is noted as 0.1 in/sec p.p.v.

TABLE 3.7-4: EFFECTS OF VIBRATION ON PEOPLE AND BUILDINGS

PEAK PARTICLE VELOCITY		*HUMAN REACTION*	*EFFECT ON BUILDINGS*
MM/SEC.	*IN./SEC.*		
0.15-0.30	0.006-0.019	Threshold of perception; possibility of intrusion	Vibrations unlikely to cause damage of any type
2.0	0.08	Vibrations readily perceptible	Recommended upper level of the vibration to which ruins and ancient monuments should be subjected
2.5	0.10	Level at which continuous vibrations begin to annoy people	Virtually no risk of "architectural" damage to normal buildings
5.0	0.20	Vibrations annoying to people in buildings (this agrees with the levels established for people standing on bridges and subjected to relative short periods of vibrations)	Threshold at which there is a risk of "architectural" damage to normal dwelling - houses with plastered walls and ceilings. Special types of finish such as lining of walls, flexible ceiling treatment, etc., would minimize "architectural" damage
10-15	0.4-0.6	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges	Vibrations at a greater level than normally expected from traffic, but would cause "architectural" damage and possibly minor structural damage.

3.7.3 IMPACTS AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the Project will have a significant impact related to noise if it will result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
- Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels;
- A substantial permanent increase in ambient noise levels in the Project vicinity above levels existing without the Project;
- A substantial temporary or periodic increase in ambient noise levels in the Project vicinity above levels existing without Project;
- For a Project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, expose people residing or working in the Project area to excessive noise levels within two miles of a public airport or public use airport; or
- For a Project within the vicinity of a private airstrip, expose people residing or working in the Project area to excessive noise levels.

The Project site is not located within two miles of a public or private airport or airstrip. Therefore, airport and airport noise is not discussed further in this analysis.

Determination of a Significant Increase in Noise Levels

The noise standards applicable to the project include the relevant portions of the City of Rancho Cordova General Plan, the City of Rancho Cordova Municipal Code described in the Regulatory Framework Section above (Section 3.7.2), and the following standards. Generally, a project may have a significant effect on the environment if it will substantially increase the ambient noise levels for adjoining areas or expose people to severe noise levels. In practice, more specific professional standards have been developed. These standards state that a noise impact may be considered significant if it would generate noise that would conflict with local project criteria or ordinances, or substantially increase noise levels at noise sensitive land uses. The potential increase in traffic noise from the project is a factor in determining significance. Research into the human perception of changes in sound level indicates the following:

- A 3-dB change is barely perceptible,
- A 5-dB change is clearly perceptible, and
- A 10-dB change is perceived as being twice or half as loud.

A limitation of using a single noise level increase value to evaluate noise impacts is that it fails to account for pre-project-noise conditions. Table 3.7-5 is based upon recommendations made by the

Federal Interagency Committee on Noise (FICON) to provide guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by the noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, it has been accepted that they are applicable to all sources of noise described in terms of cumulative noise exposure metrics such as the L_{dn}.

TABLE 3.7-5: SIGNIFICANCE OF CHANGES IN NOISE EXPOSURE

AMBIENT NOISE LEVEL WITHOUT PROJECT, LDN	*INCREASE REQUIRED FOR SIGNIFICANT IMPACT*
<60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65 dB	+1.5 dB or more

SOURCE: FEDERAL INTERAGENCY COMMITTEE ON NOISE (FICON)

Based on the Table 3.7-5 data, an increase in the traffic noise level of 5 dB or more would be significant where the pre-project noise levels are less than 60 dB L_{dn}, or 3 dB or more where existing noise levels are between 60 to 65 dB Ldn. Extending this concept to higher noise levels, an increase in the traffic noise level of 1.5 dB or more may be significant where the pre-project traffic noise level exceeds 65 dB L_{dn}. The rationale for the Table 3.7-5 criteria is that, as ambient noise levels increase, a smaller increase in noise resulting from a project is sufficient to cause annoyance.

IMPACTS AND MITIGATION MEASURES

Impact 3.7-1: The proposed Project has the potential to increase traffic noise levels at existing receptors. (Less than Significant)

PROPOSED PROJECT ANALYSIS

Tables 3.7-6 and 3.7-7 show the predicted traffic noise level increases on the local roadway network for Existing, Existing + Project, Cumulative No Project, and Cumulative + Project conditions. Appendix B of Appendix F provides the complete inputs and results of the FHWA traffic noise modeling.

[1] WHERE EXISTING NOISE LEVELS ARE LESS THAN 60 DB AN INCREASE OF 5 DB WOULD BE A SIGNIFICANT INCREASE. ADDITIONALLY, ANY INCREASE CAUSING NOISE LEVELS TO EXCEED THE CITY'S NORMALLY ACCEPTABLE 60 DB LDN NOISE LEVEL STANDARD AT AN EXISTING OUTDOOR ACTIVITY AREA OF A RESIDENTIAL USE WOULD ALSO BE SIGNIFICANT. WHERE EXISTING NOISE LEVELS EXCEED 60 DB BUT ARE LESS THAN 65 DB, AN INCREASE OF 3 DB OR MORE WOULD BE SIGNIFICANT. WHERE EXISTING NOISE LEVELS EXCEED 65 DB, AN INCREASE OF 1.5 DB OR MORE WOULD BE SIGNIFICANT.

SOURCE: FHWA-RD-77-108 WITH INPUTS FROM KIMLEY HORN AND SAXELBY ACOUSTICS. 2019.

As shown in Tables 3.7-6 through 3.7-7 some noise-sensitive receptors located along the project-area roadways are currently exposed to exterior traffic noise levels exceeding the City of Rancho Cordova 60 dB L_{dn} exterior noise level standard for residential uses. These receptors would continue to experience elevated exterior noise levels with implementation of the proposed project. For example, sensitive receptors under Existing conditions located adjacent to Sunrise Boulevard between Douglas Road and Jackson Road experience an exterior noise level of 64.6 dB L_{dn}. Under Existing + Project conditions, exterior traffic noise levels are predicted to be approximately 66.1 dB L_{dn}. Exterior noise levels in both scenarios exceed the City's exterior noise level standard of 60 dB L_{dn}. However, the project's contribution of 1.5 dB would not exceed the FICON criteria of 3 dB where existing noise levels exceed 65 dB. Therefore, this would be a **less than significant** impact.

Impact 3.7-2: The proposed Project has the potential to increase noise levels associated with construction activities. (Less than Significant with Mitigation)

During the construction of the Project including roads, water, and sewer lines and related infrastructure, noise from construction activities would add to the noise environment in the Project vicinity. Activities involved in construction would generate maximum noise levels, as indicated in Table 3.7-8, ranging from 76 to 90 dB at a distance of 50 feet. Construction activities would be temporary in nature and are anticipated to occur during normal daytime working hours.

TABLE 3.7-8: CONSTRUCTION EQUIPMENT NOISE

TYPE OF EQUIPMENT	*MAXIMUM LEVEL, DB*	
	25 FEET	*50 FEET*
Backhoe	84	78
Compactor	89	83
Compressor (air)	84	78
Concrete Saw	96	90
Dozer	88	82
Dump Truck	82	76
Excavator	87	81
Generator	87	81
Jackhammer	94	89
Pneumatic Tools	91	85

SOURCE: ROADWAY CONSTRUCTION NOISE MODEL USER'S GUIDE. FEDERAL HIGHWAY ADMINISTRATION. FHWA-HEP-05-054. JANUARY 2006.

Noise would also be generated during the construction phase by increased truck traffic on area roadways. A significant Project-generated noise source would be truck traffic associated with transport of heavy materials and equipment to and from construction sites. This noise increase would be of short duration, and would likely occur primarily during daytime hours.

Construction activities would be temporary in nature and are exempt from noise regulation during the hours of 7:00 AM to 8:00 PM on weekdays, as outlined in the City's Municipal Code for noise standard exemptions.

Implementation of the following mitigation measures will ensure that these potential impacts are reduced to a **less-than-significant** level.

MITIGATION MEASURE(S)

Mitigation Measure 3.7-1: *Construction activities shall adhere to the requirements of the City of Rancho Cordova Municipal Code with respect to hours of operation. This requirement shall be noted in the improvements plans prior to approval by the City's Public Works Department.*

Mitigation Measure 3.7-2: *All equipment shall be fitted with factory equipped mufflers, and in good working order. This requirement shall be noted in the improvements plans prior to approval by the City's Public Works Department.*

Impact 3.7-3: The proposed Project has the potential to increase noise vibration associated with construction activities. (Less than Significant with Mitigation)

The primary vibration-generating activities associated with the proposed Project would happen during construction when activities such as grading, utilities placement, and road construction occur. Sensitive receptors which could be impacted by construction-related vibrations, especially vibratory compactors/rollers, are located approximately 25 feet or further from the Project area.

Construction vibration impacts include human annoyance and building structural damage. Human annoyance occurs when construction vibration rises significantly above the threshold of perception. Building damage can take the form of cosmetic or structural damage. Table 3.7-9 shows the typical vibration levels produced by construction equipment.

TABLE 3.7-9: VIBRATION LEVELS FOR VARYING CONSTRUCTION EQUIPMENT

TYPE OF EQUIPMENT	PEAK PARTICLE VELOCITY @ 25 FEET (INCHES/SECOND)	PEAK PARTICLE VELOCITY @ 100 FEET (INCHES/SECOND)
Large Bulldozer	0.089	0.011
Loaded Trucks	0.076	0.010
Small Bulldozer	0.003	0.000
Auger/drill Rigs	0.089	0.011
Jackhammer	0.035	0.004
Vibratory Hammer	0.070	0.009
Vibratory Compactor/roller	0.210	0.026

SOURCE: FEDERAL TRANSIT ADMINISTRATION, TRANSIT NOISE AND VIBRATION IMPACT ASSESSMENT GUIDELINES, MAY 2006

With the exception of vibratory compactors, the Table 3.7-9 data indicate that construction vibration levels anticipated for the project are less than the 0.2 in/sec threshold at a distance of 25 feet. Use of vibratory compactors within 26 feet of the adjacent buildings could cause vibrations in excess of 0.2 in/sec. Therefore, this is a **potentially significant** impact.

Implementation of the following mitigation measures will ensure that these potential impacts are reduced to a **less-than-significant** level.

MITIGATION MEASURE(S)

Mitigation Measure 3.7-3: *Any compaction required less than 26 feet from the adjacent residential structures to the north should be accomplished by using static drum rollers which use weight instead of vibrations to achieve soil compaction. As an alternative to this requirement, pre-construction crack documentation and construction vibration monitoring could be conducted to ensure that construction vibrations do not cause damage to any adjacent structures.*

Impact 3.7-4: The proposed Project has the potential to expose new sensitive receptors to excessive transportation noise. (Less than Significant with Mitigation)

The FHWA traffic noise prediction model was used to predict Cumulative + Project traffic noise levels at the proposed residential land uses associated with the project. Table 3.7-10 shows the predicted traffic noise levels at the proposed residential uses adjacent to the major Project-area arterial roadways. Table 3.7-10 also indicates the property line noise barrier heights required to achieve compliance with an exterior noise level standard of 60 dB L_{dn}.

The complete inputs and results to the FHWA traffic noise prediction model and barrier calculations are contained in the Noise Study Appendix B (see Appendix F of this EIR). The modeled noise barriers assume flat site conditions where roadway elevations, base of wall elevations, and building pad elevations are approximately equivalent.

To describe future noise levels due to traffic, FHWA Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. Direct inputs into the model included traffic volumes provided by Kimley Horn. The FHWA model is based upon the Calveno reference noise factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site. The FHWA model was developed to predict hourly L_{eq} values for free-flowing traffic conditions. To predict L_{dn}/CNEL values, it is necessary to determine the day/night distribution of traffic and adjust the traffic volume input data to yield an equivalent hourly traffic volume.

TABLE 3.7-10: CUMULATIVE + PROJECT TRANSPORTATION NOISE LEVELS AT PROPOSED RESIDENTIAL USES

SEGMENT	APPROXIMATE RESIDENTIAL SETBACK, FEET[1]	ADT	PREDICTED TRAFFIC NOISE LEVELS, DB L_{DN}[2]					
			NO WALL	6' WALL	7' WALL	8' WALL	9' WALL	10' WALL

Rancho Cordova Parkway								
Douglas Rd. to Chrysanthy Blvd.	100	22140	66	61	60	59	58	57
Chrysanthy Blvd. to Keifer Blvd.	525	8965	52	46	45	44	44	43

NOTES: ADT = AVERAGE DAILY TRIPS

[1] SETBACK DISTANCES ARE MEASURED IN FEET FROM THE CENTERLINES OF THE ROADWAYS TO THE CENTER OF RESIDENTIAL BACKYARDS.

[2] THE MODELED NOISE BARRIERS ASSUME FLAT SITE CONDITIONS WHERE ROADWAY ELEVATIONS, BASE OF WALL ELEVATIONS, AND BUILDING PAD ELEVATIONS ARE APPROXIMATELY EQUIVALENT. SOUND WALL HEIGHT MAY BE ACHIEVE D THROUGH THE USE A WALL AND EARTHEN BERM TO ACHIEVE THE TOTAL HEIGHT (I.E. 6-FOOT WALL ON 2-FOOT BERM IS EQUIVALENT TO AN 8-FOOT TALL WALL).

SOURCE: FHWA-RD-77-108 WITH INPUTS FROM KIMLEY HORN AND SAXELBY ACOUSTICS. 2019.

Table 3.7-10 data indicate that noise barriers 6-7 feet in height would generally be sufficient to achieve compliance with the City of Rancho Cordova 60 dB L_{dn} exterior noise level standard for the proposed residential uses.

INTERIOR NOISE IMPACTS

Modern construction typically provides a 25-dB exterior-to-interior noise level reduction with windows closed. Therefore, sensitive receptors exposed to exterior noise of 70 dB L_{dn}, or less, will typically comply with the City of Rancho Cordova 45 dB L_{dn} interior noise level standard. Additional noise reduction measures, such as acoustically-rated windows, are generally required for exterior noise levels exceeding 70 dB L_{dn}.

It should be noted that exterior noise levels are typically 2 to 3 dB higher at second floor locations. Additionally, noise barriers do not reduce exterior noise levels at second floor locations. The proposed residential uses are predicted to be exposed to unmitigated first floor exterior transportation noise levels ranging between 52 to 66 dB L_{dn}. Therefore, second floor facades are predicted to be exposed to exterior noise levels of up to 55 to 69 dB L_{dn}.

Based upon a 25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to range between 30 to 44 dB L_{dn}. Accordingly, predicted interior noise levels along the first row of residential uses closest to Chrysanthy Boulevard and Rancho Cordova Parkway would comply with the City's 45 dB L_{dn} interior noise level standard. Therefore, additional interior noise control measures would not be required for these residential uses.

This analysis assumes that mechanical ventilation will be provided to allow residents to keep doors and windows closed, as desired for acoustical isolation. With implementation of the following interior and exterior mitigation measures, the proposed Project would be a **potentially significant** impact relative to this environmental topic.

Implementation of the following mitigation measures will ensure that these potential impacts are reduced to a **less-than-significant** level.

MITIGATION MEASURE(S)

Mitigation Measure 3.7-4: *6- to 7-foot tall sound walls and/or landscaped berm combinations shall be constructed along the primary Project-area roadways, adjacent to proposed residential uses, in order to achieve the City's exterior noise standards. See Table 3.7-10 of Section 3.7 of the Draft EIR for specific noise barrier heights along each roadway. Noise barrier walls shall be constructed of concrete panels, concrete masonry units, earthen berms, or any combination of these materials. Wood is not recommended due to eventual warping and degradation of acoustical performance. These requirements shall be included in the improvements plans prior to their approval by the City's Public Works Department.*

Serial: 1800

Measurement Results, dBA

Duration:	0:10
L_{eq}:	53
L_{max}:	64
L_{min}:	45
L_{50}:	49
L_{90}:	47

Notes

Construction at housing development to the west is the primary noise source. Nail gun, hammering, and heavy trucks idling contributed to ambient noise level, with impulsive noise sources measured at approximately 55 dB.

EXECUTIVE SUMMARY

This report documents the results of a traffic impact analysis completed for Jaeger Ranch project (the "proposed project" or "project"). The vacant project site is located along Rancho Cordova Parkway/Jaeger Road, south of Douglas Road in Rancho Cordova, California. This study was performed in accordance with the County of Sacramento's traffic study guidelines and standards established by the Circulation Element of the City of Rancho Cordova's General Plan.

The proposed project will include 666 single-family detached residential units, 120 multi-family residential units, 637 Active Adult Residential (AAR) units, and approximately 46,000 square-feet of commercial uses. Access to the project site will be provided by Chrysanthy Boulevard, which, as a part of the project, will be extended from Rancho Cordova Parkway/Jaeger Road to the eastern extent of the project. The project is not expected to construct Chrysanthy Boulevard to its eventual connection with Grant Line Road. Chrysanthy Boulevard extends through the project and serves as a primary internal facility. Rancho Cordova Parkway provides additional access to the site, from south of Chrysanthy Boulevard. The project is conditioned to widen Rancho Cordova Parkway along the project extents from two (2) to four (4) lanes. In addition, the project will construct a pedestrian tunnel crossing along Chrysanthy Boulevard within the project site, two (2) pedestrian push button crossing within the project site, and one (1) pedestrian push button crossing along Rancho Cordova Parkway adjacent to the project.

This analysis includes evaluation of the following transportation facilities:

- 40 Intersections (13 for Cumulative Conditions only)
  - 31 within Rancho Cordova (13 for Cumulative Conditions only)
  - 9 within Sacramento County's jurisdiction
- 46 Roadway Segments (17 for Cumulative Conditions only)
  - 38 within Rancho Cordova (16 for Cumulative Conditions only)
  - 8 within Sacramento County's jurisdiction (1 for Cumulative Conditions only)

Based on the County's requirements, this traffic impact analysis was conducted for the study facilities for the following scenarios:

A. Existing (2017) Conditions
B. Existing (2017) plus Proposed Project Conditions
C. Cumulative (2040) Conditions
D. Cumulative (2040) plus Proposed Project Conditions

Significant findings of this study include:

- The proposed project is estimated to generate 10,266 new daily trips, with 721 new trips occurring during the AM peak-hour, and 934 new trips occurring during the PM peak-hour.
- The addition of the proposed project to the Existing (2017) Conditions results in a significant impact at four (4) study intersections and one (1) roadway segment. With the application of mitigation measures recommended herein, the impacts to intersections can be mitigated to be *less than significant*. The proposed project results in one significant impact to the roadway segments for Existing (2017) Conditions, as defined by the City of Rancho Cordova. This roadway segment is already built to its final extents per the City's General Plan.
- The addition of the proposed project to Cumulative (2040) Conditions results in a significant impact at three (3) intersections. Two of the impacts to intersections would be mitigated to less than significant. One location does not have a feasible mitigation. The proposed project results in a significant impact at two (2) roadway segments for Cumulative (2040) Conditions.

INTRODUCTION

This report documents the results of a traffic impact analysis completed for Jaeger Ranch residential project (the "proposed project" or "project"). The vacant project site is located along Rancho Cordova Parkway/Jaeger Road, south of Douglas Road in Rancho Cordova, California. The purpose of this impact analysis is to identify potential environmental impacts to transportation facilities as required by the California Environmental Quality Act (CEQA). This study was performed in accordance with the County of Sacramento's traffic study guidelines[1] and standards established by the Circulation Element of the City of Rancho Cordova's General Plan [2].

PROJECT DESCRIPTION

The proposed project will include 666 single-family detached residential units, 120 multi-family residential units, 637 Active Adult Residential (AAR) units, and approximately 46,000 square feet of commercial uses. Primary access to the project site will be provided by Chrysanthy Boulevard, which will be extended from Rancho Cordova Parkway/Jaeger Road to the eastern extent of the project. Chrysanthy Boulevard extends through the project and serves as a primary external access roadway. The project is not expected to construct Chrysanthy Boulevard to its eventual connection with Grant Line Road.

Rancho Cordova Parkway provides additional access to the site, from south of Chrysanthy Boulevard. The project is conditioned to widen Rancho Cordova Parkway along the project extents from two (2) to four (4) lanes. Rancho Cordova parkway currently is unpaved north of Chrysanthy Boulevard, but is expected to be constructed to City standards in the future. In addition, the project will construct a pedestrian tunnel crossing along Chrysanthy Boulevard within the project site, two (2) pedestrian push button crossing within the project site, and one (1) pedestrian push button crossing along Rancho Cordova Parkway adjacent to the project. The project location, study intersections and study segments are depicted in **Figure 1.** The proposed project site plan is shown in **Figure 2**. **Figure 3** illustrates the existing study intersections facilities, traffic control, and lane configurations.

Based on the County's requirements, this traffic impact analysis was conducted for the study facilities for the following scenarios:

A. Existing (2017) Conditions
B. Existing (2017) plus Proposed Project Conditions
C. Cumulative (2040) Conditions
D. Cumulative (2040) plus Proposed Project Conditions

The following transportation facilities are included in this evaluation, including the additional study facilities for the Cumulative (2040) scenario:

Existing (2017) Intersections:

1. Jackson Rd/SR-16 @ Bradshaw Rd
2. Jackson Rd/SR-16 @ Excelsior Rd
3. Jackson Rd/SR-16 @ Eagles Nest Rd

PROJECT AREA ROADWAYS

The following are descriptions of the primary roadways in the vicinity of the project.

United States Route 50 (US-50) is an east-west interstate facility located approximately 5-miles from the proposed project. US-50 connects Rancho Cordova to Sacramento to the west and El Dorado County to the east. Primary access to the project site from US-50 is provided at the Sunrise Boulevard, Zinfandel Drive and Mather Field Road interchanges. Near Zinfandel Drive, US-50 carries approximately 170,000 vehicles per day[3] with five lanes in each direction.

Jackson Road (SR 16) is an expressway connecting Amador County and Sacramento County, along the southern edge of Rancho Cordova's city limits. Jackson Road connects with US 50 west of the project site. South of the project site, between Sunrise Boulevard and Grant Line Road, Jackson Road carries approximately 13,000 vehicles per day.

Sunrise Boulevard is a north-south arterial, connecting the project site to north Rancho Cordova and Placer County.

Zinfandel Drive is a north-south arterial, connecting the project site to US-50, as well as the commercial, industrial and residential areas northwest of the project site.

Chrysanthy Boulevard is a local roadway adjacent to, and through the project site. The addition of the proposed project is understood to construct the segment of Chrysanthy Boulevard from Rancho Cordova Parkway/Jaeger Road to the eastern extent of the project site. Traffic lights will be constructed at intersections within the project as deemed necessary. The project is not conditioned to construct Chrysanthy Boulevard to its eventual connection with Grant Line Road.

Rancho Cordova Parkway/Jaeger Road is a local roadway adjacent to the western edge of the project site. The project is conditioned to widen Rancho Cordova Parkway along the project extents from two (2) to four (4) lanes.

TRANSPORTATION IMPACT STUDY METHODOLOGY

This study was performed in accordance with the County of Sacramento's traffic study guidelines[4] and standards established by the Circulation Element of the City of Rancho Cordova's General Plan [5].

Level of Service Definitions

Analysis of transportation facility significant environmental impacts is based on the concept of Level of Service (LOS). The LOS of a facility is a qualitative measure used to describe operational conditions. LOS ranges from A (best), which represents minimal delay, to F (worst), which represents heavy delay and a facility that is operating at or near its functional capacity.

Intersection Analysis

Levels of Service for this study were determined using methods defined in the *Highway Capacity Manual (HCM) 2010* and appropriate traffic analysis software. The HCM includes procedures for analyzing side-street stop controlled (SSSC), all-way stop controlled (AWSC), and signalized intersections. The SSSC procedure defines LOS as a function of average control delay for each minor street approach movement. The AWSC and signalized intersection procedure defines LOS as a function of average control delay for the intersection as a whole. Table 1 presents intersection LOS definitions as defined in the HCM.

[3] Caltrans Traffic Counts, 2015. http://www.dot.ca.gov/trafficops/census/
[4] *Traffic Impact Analysis Guidelines, July 2004*, County of Sacramento.
[5] *City of Rancho Cordova General Plan: Circulation Element, May 2015,* City of Rancho Cordova

Table 1 – Intersection Level of Service Criteria

Level of Service (LOS)	Unsignalized	Signalized
	Average Control Delay* (sec/veh)	Average Control Delay (sec/veh)
A	≤ 10	≤ 10
B	> 10 – 15	> 10 – 20
C	> 15 – 25	> 20 – 35
D	> 25 – 35	> 35 – 55
E	> 35 – 50	> 55 – 80
F	> 50	> 80

* Applied to the worst lane/lane group(s) for SSSC

Roadway Segment Analysis

The analysis of roadway segments involves the comparison of daily segment volumes to the LOS criteria provided in the County's traffic impact analysis guidelines[1]. The criteria provide maximum volumes for given service levels for various facility types. Table 2 replicates the County's roadway segment LOS criteria.

Table 2 – Roadway Segment Level of Service Criteria

Facility Type	# Lanes	Maximum Volume for Given Service Level				
		A	B	C	D	E
Residential	2	600	1,200	2,000	3,000	4,500
Residential Collector w/ Frontage	2	1,600	3,200	4,800	6,400	8,000
Residential Collector w/o Frontage	2	6,000	7,000	8,000	9,000	10,000
Arterial, Low Access Control	2	9,000	10,500	12,000	13,500	15,000
	4	18,000	21,000	24,000	27,000	30,000
	6	27,000	31,500	36,000	40,500	45,000
Arterial, Moderate Access Control	2	10,800	12,600	14,400	16,200	18,000
	4	21,600	25,200	28,800	32,400	36,000
	6	32,400	37,800	43,200	48,600	54,000
Arterial, High Access Control	2	12,000	14,000	16,000	18,000	20,000
	4	24,000	28,000	32,000	36,000	40,000
	6	36,000	42,000	48,000	54,000	60,000
Rural, 2-lane highway	2	2,400	4,800	7,900	13,500	22,900
Rural, 2-lane road, 24'-36' of pavement, paved shoulders	2	2,200	4,300	7,100	12,200	20,000
Rural, 2-lane road, 24'-36' of pavement, no shoulders	2	1,800	3,600	5,900	10,100	17,000

Source: Traffic Impact Analysis Guidelines, Table 2, County of Sacramento Department of Transportation, July 2004.

Based on the County's requirements[4], this LOS analysis was conducted for the study facilities for the following scenarios:

A. Existing (2017) Conditions
B. Existing (2017) plus Proposed Project Conditions
C. Cumulative (2040) Conditions
D. Cumulative (2040) plus Proposed Project Conditions

The following sections present the technical analysis results for the four primary scenarios.

EXISTING (2017) CONDTIONS

To establish existing conditions, new traffic counts were collected for the study intersections and roadway segments. Twenty-seven (27) new weekday AM (7-9 a.m.) and PM (4-6 p.m.) peak-period intersection turning movement traffic counts were collected on September 28, 2017. Twenty-nine (29) new roadway segment counts were conducted on September 28, 2017.

Existing (2017) peak-hour turn movement volumes are presented in Figure 4, and the traffic count data sheets are provided in Appendix A. Analysis worksheets for this scenario are provided in Appendix B.

Intersections

Table 3 presents the peak-hour intersection operating conditions for this analysis scenario. As indicated in Table 3, the study intersections operate from LOS A to LOS F during the AM and PM peak-hours.

Table 3 – Existing (2017) Intersection Levels of Service

ASSESSMENT OF PROPOSED PROJECT

Proposed Project Trip Generation and Assignment

The number of trips anticipated to be generated by the proposed project are approximated using data included in *Trip Generation, 9th Edition,* published by the Institute of Transportation Engineers (ITE).

According to the proposed project site plan, 666 market rate single family detached units (SFR), 120 multi-family multifamily housing units and 637 AAR units are proposed for the site. Active Adult Residential (AAR) refers to detached senior housing units. This land use type is understood to have trip characteristics that generate fewer daily trips when compared to non-age restrictive land use types. In fact, as described in *Trip Generation*, the daily trip rate for AAR is 61 percent less than the daily trip rate for SFR. In addition, the AM and PM peak-hour trip rates for AAR are 71 percent and 73 percent less than the AM peak-hour and PM peak-hour trip rates for SFR, respectively.

To represent this development, ITE Land Use Codes 210 (Single Family Detached Housing), 220 (Apartment), 251 (Senior Adult Housing - Detached) and 820 (Shopping Center) were applied. As shown in Table 5, the proposed project is estimated to generate 10,266 new daily trips, with 721 new trips occurring during the AM peak-hour, and 934 new trips occurring during the PM peak-hour. Internal capture rates of 3.23 percent and 10.04 percent were applied to the AM and PM peak-hours, respectively. For the commercial uses, a pass-by reduction of 34% was applied for the PM peak-hour, in accordance with the ITE Trip Generation Handbook, 9th Edition.

Table 5 – Proposed Project Trip Generation

Land Use (ITE Code)	Size (DU/KSF)	Daily Trips	AM Peak Hour			PM Peak Hour		
			Total	In	Out	Total	In	Out

Study Intersection
AM(PM)
Peak-hour Turning Movement Volumes

EXISTING (2017) PLUS PROPOSED PROJECT CONDTIONS

As previously discussed, the number of trips anticipated to be generated by the proposed project was derived using the *Trip Generation Manual, 9th Edition,* published by the Institute for Traffic Engineering (ITE). These trips were assigned to the roadway network based on existing traffic volumes, output from the SACSIM travel demand model, and professional judgment. Using these volumes, levels of service were determined at the study facilities. Existing (2017) plus Proposed Project peak-hour turn movement volumes are presented in Figure 7. Levels of service were then determined at the study facilities. Analysis worksheets for this scenario are provided in Appendix C.

Table 6 presents the intersection operating conditions for this analysis scenario. As indicated in Table 6, the study intersections operate from LOS A to LOS F during the AM and PM peak-hours.

Table 7 presents the roadway segment operating conditions for this analysis scenario. As indicated in Table 7, the study roadway segments operate from LOS A to LOS F.

Table 6 – Existing (2017) plus Proposed Project Intersection Levels of Service

Peak-hour Turning Movement Volumes

CUMULATIVE CONDITIONS

Future traffic estimates were prepared using the modified SACSIM travel demand model developed by the City of Rancho Cordova for the 2040 General Plan. The difference between the resulting traffic estimate and the 2012 baseline model results (the growth) was then added to Existing (2017) traffic volumes to establish Cumulative (2040) traffic estimates for this study. Using these volumes and network changes, levels of service were determined at the study facilities. Analysis worksheets for this scenario are provided in Appendix D. The future roadway network and additional study facilities for the Cumulative (2040) scenario are shown in Figure 8. Figure 9 depicts the assumed lane geometries for the Cumulative (2040) scenario. Cumulative peak-hour turning movement volumes are presented in Figure 10.

Table 8 presents the peak-hour intersection operating conditions for this analysis scenario. As indicated in Table 8, the study intersections operate from LOS A to LOS F during the AM and PM peak-hours.

Table 9 presents the roadway segment operating conditions for this analysis scenario. As indicated in Table 9, the study roadway segments operate from LOS A to LOS F.

Table 8 – Cumulative (2040) Intersection Levels of Service

CUMULATIVE PLUS PROPOSED PROJECT CONDITIONS

As previously discussed, the number of trips anticipated to be generated by the proposed project was derived using the *Trip Generation Manual, 9th Edition,* published by the Institute for Traffic Engineering (ITE). The project trips were assigned to the future roadway network based on modified SACSIM travel demand model, as provided by the City of Rancho Cordova. Using these volumes, levels of service were determined at the study facilities.

The Cumulative Scenario Project Trip distribution and trip assignment are shown in Figure 11 and Figure 12, respectively. Cumulative plus Proposed Project peak-hour turning movement volumes are presented in Figure 13. Analysis worksheets for this scenario are provided in Appendix E.

Table 10 presents the peak-hour intersection operating conditions for this analysis scenario. As indicated in Table 10, the study intersections operate from LOS A to LOS F during the AM and PM peak-hours.

Table 11 presents the roadway segment operating conditions for this analysis scenario. As indicated in Table 11, the study roadway segments operate from LOS A to LOS F.

Table 10 – Cumulative plus Proposed Project Intersection Levels of Service

IMPACTS AND MITIGATION

Regulatory Setting and Thresholds of Significance

Sacramento County

The Circulation Element of the latest County of Sacramento General Plan[6] includes the following relevant provisions:

> *CI-9. Plan and design the roadway system in a manner that meets Level of Service (LOS) D on rural roadways and LOS E on urban roadways, unless it is infeasible to implement project alternatives or mitigation measures that would achieve LOS D on rural roadways or LOS E on urban roadways. The urban areas are those areas within the Urban Service Boundary as shown in the Land Use Element of the Sacramento County General Plan. The areas outside the Urban Service Boundary are considered rural.*
>
> *CI-35. The applicant/developer of land development projects shall be responsible to install bicycle and pedestrian facilities in accordance with Sacramento County Improvement Standards and may be responsible to participate in the fair share funding of regional multi-use trails identified in the Sacramento County Bicycle Master Plan.*

Sacramento County's traffic study guidelines[1] provide guidelines for the implementation of the General Plan provisions: "The County defines the minimum acceptable operation level for its roadways and intersections to be LOS D for rural areas and LOS E for urban areas. The urban areas are those areas within the Urban Service Boundary as shown in the Land Use Element of the Sacramento County General Plan. The areas outside the Urban Service Boundary are considered rural."

All of the Sacramento County study facilities are within the Urban Services Boundary. Therefore, LOS E is the minimum acceptable LOS for all County facilities.

Thresholds of Significance

Roadways/Signalized Intersections: A project is considered to have a significant effect if it would:

- result in a roadway or a signalized intersection operating at an acceptable LOS to deteriorate to an unacceptable LOS; or
- increase the V/C ratio by more than 0.05 at a roadway or at a signalized intersection that is operating at an unacceptable LOS without the project.

Unsignalized Intersections: A project is considered to have a significant effect if it would:

- result in an unsignalized intersection movement/approach operating at an acceptable LOS to deteriorate to an unacceptable LOS, and also cause the intersection to meet a traffic signal warrant; or
- for an unsignalized intersection that meets a signal warrant, increase the delay by more than 5 seconds at a movement/approach that is operating at an unacceptable LOS without the project.

[6] *Sacramento County General Plan of 2005-2030,* Sacramento County Community Planning & Development Department, November 9, 2011.

City of Rancho Cordova

The Circulation Element of the City of Rancho Cordova's General Plan 2030 includes the following relevant provisions:

> *Policy C.1.2 - Seek to maintain operations on all roadways and intersections at Level of Service D or better at all times, including peak travel times, unless maintaining this Level of Service would, in the City's judgment, be infeasible and/or conflict with the achievement of other goals. Congestion in excess of Level of Service D may be accepted in these cases, provided that provisions are made to improve traffic flow and/or promote non-vehicular transportation as part of a development project or a City-initiated project. Please see Policy C.1.3 for additional policy guidance related to this issue.*
>
> *Examples of system improvements which may be accepted when Level of Service D cannot be maintained include the following, where the improvement or funding is in excess of standard City requirements:*
> *• Development of on- or off-street bicycle or pedestrian circulation (not including sidewalks that are constructed as part of roadway improvements);*
> *• Providing or funding public transportation facilities or services;*
> *• Other features as determined appropriate by the City.*
>
> *Policy C.1.3 - Recognize that regional traffic beyond the City's control, as well as circulation system decisions made prior to incorporation or by other agencies, will make it infeasible to achieve the City's desired Level of Service on all roadways. Subject development projects which affect these roadways to the provisions of Policy C.1.2 to provide offsetting improvements to the vehicular and/or non-vehicular transportation system.*

Impacts and Mitigation

Existing (2017) plus Proposed Project Conditions

As reflected in Table 6 and Table 7, the addition of the proposed project results in five (5) significant impacts. Analysis worksheets for the mitigations for this scenario are provided in Appendix F. The following is a discussion of each impact and its associated mitigation.

Intersection Impacts:

I1. *Intersection #3, Jackson Road @Eagles Nest Road*
As shown in Table 6, this intersection operates at unacceptable LOS F during the AM and PM peak-hours without the project, and the project adds more than 5 seconds of delay to the northbound left turn movement during the AM and PM peak-hours. ***This is a significant impact***.

I2. *Intersection #9, Grant Line Road @ Sunrise Boulevard*
As shown in Table 6, this intersection operates at unacceptable LOS F during the AM peak-hour without the project, and the project adds more than 5 seconds of delay to the intersection. ***This is a significant impact***.

I3. *Intersection #11, Douglas Road @ Sunrise Boulevard*
As shown in Table 6, this intersection operates at LOS D during the PM peak-hour without the project, and the project results in LOS E. ***This is a significant impact***.

I4. Intersection #25, Sunrise Boulevard @ Zinfandel Drive
As shown in Table 6, this intersection operates at unacceptable LOS E during the PM peak-hour without the project, and the project adds more than 5 seconds of delay to the intersection. ***This is a significant impact***.

Roadway Segment Impacts:

I5. Roadway Segment #22, Sunrise Boulevard between US-50 and Folsom Boulevard
As shown in Table 7, this roadway segment operates at unacceptable LOS E without the project and the project increases the volume-to-capacity ratio by more than 0.05. ***This is a significant impact.***

Mitigations:

M1. Intersection #3, Jackson Road and Eagles Nest Road
The significant impact at this intersection during the AM and PM peak-hours can be mitigated by converting the intersection from side street stop controlled to signalized. As shown in Table 12, with this mitigation the intersection operates at LOS B during the AM and PM peak-hours. Therefore, ***this impact is less than significant***. However, the identified improvement falls under the jurisdiction of the County; therefore, neither the City nor the project applicant would have control over their timing or implementation. Thus, this impact would remain ***significant and unavoidable***. If the County allows the improvement to move forward, the impact would be classified as significant in the short term but eventually would be reduced to a less-than-significant level in the long term.

M2. Intersection #9, Grant Line Road @ Sunrise Boulevard
The significant impact at this intersection during the AM peak-hour can be mitigated by changing the southbound approach to include a right turn lane and an all-purpose lane. This mitigation includes restriping the southbound approach to move the bicycle lane from its existing location between the two travel lanes to the right shoulder and add hatching for the right turns, consistent with the Optional Through Right and Right-Turn-Only lane configuration included in Figure 9C-4a (CA) of the CaMUTCD[7]. As shown in Table 12, this mitigation measure results in the intersection operating at LOS D or better during the AM and PM peak-hours. Therefore, ***this impact is less than significant***. However, the identified improvement falls under the jurisdiction of the County; therefore, neither the City nor the project applicant would have control over their timing or implementation. Thus, this impact would remain ***significant and unavoidable***. If the County allows the improvement to move forward, the impact would be classified as significant in the short term but eventually would be reduced to a less-than-significant level in the long term.

M3. Intersection #11, Douglas Road @ Sunrise Boulevard
The significant impact at this intersection during the PM peak-hour can be mitigated through signal timing optimization and the addition of a right-turn overlap signal phase for the eastbound right-turn, overlapping with the northbound left-turn movement. As shown in Table 12, this mitigation measure results in the intersection operating at LOS D or better during the AM and PM peak-hours. Therefore, ***this impact is less than significant***.

[7] California MUTCD 2014 Edition. Chapter 9C-Markings: Part 9 Traffic Control for Bicycle Facilities. November 2014

M4. Intersection #25, Sunrise Boulevard @ Zinfandel Drive

The significant impact at this intersection during the PM peak-hour can be mitigated by restriping the eastbound and westbound approaches to include a left turn lane and through-right lane. As shown in Table 12, this mitigation measure results in the intersection operating at LOS D or better during the AM and PM peak-hours. Therefore, ***this impact is less than significant***

M5. Roadway Segment #22, Sunrise Boulevard between US-50 and Folsom Boulevard

This roadway segment is an existing deficiency and is currently has the maximum number of lanes for the General Plan designation. Therefore, there is no feasible construction mitigation and until an alternative mitigation is identified, ***this impact is significant and unavoidable.***

Table 12 – Intersection Levels of Service – Existing (2017) plus Proposed Project Mitigated Conditions

#	Intersection	Existing Plus Project				Existing Plus Project Mitigated			
		AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
		Delay (Seconds)	LOS	Delay (Seconds)	LOS	Delay (Seconds)	LOS	Delay (Seconds)	LOS
3	Jackson Rd/SR-16 @ Eagles Nest Rd	**18.1 (95.3 NB)**	**F**	**18.9 (*ECL NB)**	**F**	19.5	B	15.7	B
9	Grant Line Rd @ Sunrise Blvd	**122.2**	**F**	55	D	37.6	D	25.4	C
11	Douglas Rd @ Sunrise Blvd	34.4	C	**59.3**	**E**	34.0	C	48.9	D
25	Sunrise Blvd @ Zinfandel Dr	117.2	F	**68**	**E**	88.7	F	50.9	D

Cumulative plus Proposed Project Conditions

As reflected in Table 10 and Table 11, the addition of the proposed project results in five (5) significant impacts. Analysis worksheets for the mitigations for this scenario are provided in Appendix F. The following is a discussion of each impact and its associated mitigation.

Intersection Impacts:

I6. Intersection #10, Douglas Road @ Zinfandel Drive

As shown in Table 10, this intersection operates at unacceptable LOS F during the AM peak-hour without the project, and the project adds more than 5 seconds of delay to the intersection during the AM peak-hour. ***This is a significant impact***.

I7. Intersection #11, Douglas Road @ Sunrise Boulevard

As shown in Table 10, this intersection operates at unacceptable LOS F during the AM peak-hour without the project, and the project adds more than 5 seconds of delay to the intersection during the AM peak-hour. ***This is a significant impact***.

I8. Intersection #27, White Rock Road @Prairie City Road

As shown in Table 10, this intersection operates at unacceptable LOS F during the AM and PM peak-hour without the project, and the project adds more than 5 seconds of delay to the intersection during the PM peak-hour. ***This is a significant impact***.

Roadway Segment Impacts:

I9. Roadway Segment #24, Sunrise Boulevard between White Rock Road and Douglas Road

As shown in Table 11, this roadway segment operates at unacceptable LOS E during without the project, and the project increases the volume to capacity ration by more than 0.05. ***This is a significant impact***.

Mitigations:

M6. Intersection #10, Douglas Road @ Zinfandel Drive

The significant impact at this intersection during the AM peak-hour can mitigated by the conversion of the westbound right turn from permitted to a free right turn with a receiving lane. As shown in Table 13, this mitigation measure results in the intersection operating at LOS D during the AM and PM peak-hours. Therefore, ***this impact is less than significant***. However, the identified improvement falls under the jurisdiction of the County; therefore, neither the City nor the project applicant would have control over their timing or implementation. Thus, this impact would remain ***significant and unavoidable***. If the County allows the improvement to move forward, the impact would be classified as significant in the short term but eventually would be reduced to a less-than-significant level in the long term.

M7. Intersection #11, Douglas Road @ Sunrise Boulevard

The significant impact at this intersection during the AM peak-hour cannot be feasibly mitigated. The intersection of Douglas Road and Sunrise Boulevard is fully built out according to the City's General Plan. As shown in Table 13, signal timing optimization is not enough to mitigate the project impacts to acceptable conditions. Therefore, ***this impact is significant and unavoidable***. However, as described in the Rio Del Oro Specific Plan DEIR/DEIS[8], there is potential to improve conditions through additional connectivity along Sunrise Boulevard and further build out of the City's General Plan network.

M8. Intersection #27, White Rock Road @ Prairie City Road

The significant impact at this intersection during the PM peak-hour can be mitigated with the addition of a second southbound right-turn lane and the addition of a right-turn overlap signal phase for the southbound right-turn. As shown in Table 13, this mitigation measure results in the intersection operating at LOS D during the AM and PM peak-hours. Therefore, ***this impact is less than significant***.

M9.Roadway Segment #24, Sunrise Boulevard between White Rock Road and Douglas Road

This roadway segment operates unacceptably without the project and is currently has the maximum number of lanes for the General Plan designation. Therefore, there is no feasible construction mitigation and the City will need to designate an alternative mitigation. Until that alternative mitigation is identified, ***this impact is significant and unavoidable.*** However, as described in the Rio Del Oro Specific Plan DEIR/DEIS[8], there is potential to improve conditions through additional connectivity along Sunrise Boulevard and further build out of the City's General Plan network.

Table 13 – Intersection Levels of Service – Cumulative plus Proposed Project Mitigated Conditions

#	Intersection	Cummulative Plus Project				Cummulative Plus Project Mitigated			
		AM Peak Hour		PM Peak Hour		AM Peak Hour		PM Peak Hour	
		Delay (Seconds)	LOS	Delay (Seconds)	LOS	Delay (Seconds)	LOS	Delay (Seconds)	LOS
10	Douglas Rd @ Zinfandel Dr	**159.4**	**F**	43.8	D	50.0	D	43.0	D
11	Douglas Rd @ Sunrise Blvd	**112.3**	**F**	**109.3**	**F**	**93.4**	**F**	**108.2**	**F**
27	White Rock Rd @ Prairie City Rd	**144.1**	**F**	**169.7**	**F**	36.3	D	36.2	D

[8] Rio del Oro Specific Plan Project DEIR/DEIS. City of Rancho Cordova and USACE. April, 2008

CONCLUSIONS

Significant findings of this study include:

- The proposed project is estimated to generate 10,266 new daily trips, with 721 new trips occurring during the AM peak-hour, and 934 new trips occurring during the PM peak-hour.
- The addition of the proposed project to the Existing (2017) Conditions results in a significant impact at four (4) study intersections and one (1) roadway segment. With the application of mitigation measures recommended herein, the impacts to intersections can be mitigated to be *less than significant*. The proposed project results in one significant impact to the roadway segments for Existing (2017) Conditions, as defined by the applicable jurisdictions.
- The addition of the proposed project to Cumulative (2040) Conditions results in a significant impact at three (3) intersections and two (2) roadway segments. Two of the impacts to intersections would be mitigated to less than significant. One location does not have a feasible mitigation. One of the impacts to the roadway segments would be mitigated to less than significant and the proposed project results in one significant impact to the roadway segments for Cumulative (2040) Conditions, as defined by the applicable jurisdictions.
